Thread: [Can you hack wifi if you know the router config password but not the wifi password?](#)

zetustiger5 - May 17, 2016, 9:08 am

If there is a modem that I know the user/pass to the administrator router configuration panel through the ipv4 default gateway IP, is there any way I could find out the wifi password to it? If I'm not already connected.

theChive - May 17, 2016, 9:09 am

Knowing the router CP password doesn't do much if you can't connect to the network. Try running some tests on the network with a tool like Kali Linux.

If you are able to connect to the network, the CP login credential will be very useful.

Maybe you can login into the network if you can then enable remote access the cp?

This reminds me.

If you can get access to a system that is already connected to the network, you can then gain access to the CP from that system and allow yourself to connect by manually adding your MAC address to it or simply viewing the current password and using it to connect your own device.

Cant login without wifi pass.

If you are able to connect to the network, the CP login credential will be very useful. What tests? where can I find tuts about these tests?

Btw, what are some cool things that can be done if with the cp login credentials? aside from seeing who's connected to the network?

nuckle - May 17, 2016, 9:22 am

If you have physical access to the device hardware and login to check for that feature. If not infect a device on the network already.

theChive - May 17, 2016, 9:24 am

Well Kali Linux is a tool that has a crap load of other tools inside it. You should really play around with it and get to know it before actually trying to attack anything or anyone with it.

As for the CP details: if you can log on, you can do pretty much anything to the network. You can change the WiFi password, add and remove users from the network, filter websites, bottleneck up and down speeds, and depending on the router, send files to various machines on the network opening a whole new set of doors.

If you haven't already, take a look on this thread:

Also do you have the model number since you have the other info. You can do research on the modem or router to see if it is vulnerable, etc.

No no. I don't have nothing.

I only have the DEFAULT user/pass because the guy didnt change it.

I only have the DEFAULT user/pass because the guy didnt change it. Okay then I would go with kali linux and use reaver or whatever you prefer to try to get into the device. Evil twin, phishing, SE, etc. Good luck!

?

deknauf - May 17, 2016, 11:17 am

Are they using a commonly used wifi router such as "Sitecom"?

Try googling the SSID name for the password (works for some very old models)

shabbu.shah - May 19, 2016, 12:15 am

You can buy alpha wireless adapter and use Kali to crack the password.

what do you add your MAC address to?

22gotya - November 5, 2016, 9:04 pm

As some other users stated CP access is useless without WIFI access

ash47 - November 6, 2016, 1:19 am

If i am right, you can change the WiFi password from the router configuration panel.

22gotya - November 6, 2016, 1:21 am

You need to be on the network to do this.....192.168.0.1 etc will only connect to your own CP.....
