Thread: [Pinging a Mac/Booting it off a network](#)

101100 - May 24, 2016, 12:44 am

G'day Everyone,

I don't know if this is a stupid question or not but I have only recently started messing around with hacking and all that and i want to know if there is a way to ping/kick someone off a wifi network like you can on windows using CMD. I have a list of all devices that are connected to the wifi which includes their last known IP Address and their MAC Address as well as what device it is and the name of it. If this is of any use and could be possible could you please let me know, Thanks!

-101100

PS. If this is a stupid question try not go all out savage on me, I have seen how some people get replies ?

Quickest way would be to set up Mac filtering on your router and allow all MACs except the one you want to boot. Although I believe AirCrack-ng has the ability to send deauth tickets to wifi clients.
