You can either dual boot or dual boot them remove other partition and just keep the OS X.

First of all make sure your laptop hardware is supported by iOS, otherwise it will be an hell to configure it and make it work. I still suggest to go through a VM, easy and painless if you have enough resources.

I tried an Hackintosh in the past and decided it wasn't worth the [bad] experience.

Using MacOS X on Apple hardware is a totally different experience, much more enjoyable.

you have to use hacked/pirated files, honestly it isn't that worth it, trust me i tried.

If it's apple hardware you'll have no problem..it it's not apple hardware you'll have to make a hackintosh, which is completely retarded and useless for everything.
