Thread: [antivirus and some security questions](#)

shahwahababdul - June 2, 2016, 7:56 am

Hello guys Hope you all doing good

wanted some questions if someone could help

1)which antivirus to chose give your opinion the best of the best
money is not an issue
if you cant suggest any better then below then chose one from below

Eset Nod32 vs Eset smart security???

what softwares do i need to install and keep running to make 110% sure that i wont get infected

I will Appreciate it

Thanks Guys
Regards
Abdul Wahab

I personally recommend WebRoot as it is cloud based and scans 100x faster than any other anti-virus.

However, it is always a good idea to have malwarebytes as well.

Remember that you can still get infected even if you have an anti-virus. Virus's can be undetectable by your anti-virus so just download responsibly.

Malwarebytes is free. Do not buy it.

Typically choosing an anti-virus is generally personal preference they are all good at detecting virus's some detect certain virus's better than others.

However, like I said just download with caution and you will be safe.

Also, type in "msconfig" in your start menu and hit enter. Then click start-up.

You will see programs that are set to automatically start when you boot up your computer.

If you see something you do not recognize or you are unsure about, it is possible that it is a virus. Do not disable anything unless you are 100% sure, so make sure to ask around here before doing so.

Best of luck to you!

Thank you for your time mate hope to see other guys feedback aswell

EliteTM - June 3, 2016, 9:19 pm

Like what was said above, it is all personal preference. My preferred "setup" is Avast Anti-virus (the free one) as the active/real-time protection or an alternative, is I like to use Panda Anti-virus (the free one aswell). Then I would manually run Malware-bytes daily, weekly or monthly (Malware-bytes in my opinion is the only protection software I would pay for). I personally don't like to pay for the premium options, but that again that is just me and it does support the company.

Elweth - June 4, 2016, 12:27 am

If you got the money and resources, go for Kaspersky. It comes with a full suite of protection.

shahwahababdul - June 4, 2016, 2:40 am

Thanks guys for the opinions Really Appreciate it and conclusion is

Malwarebyte is a must having software and i would to buy pro version for the realtime protection and will decide on which antivirus to chose :D

Captain Steve Rogers - June 4, 2016, 3:50 am

I would suggest Avast and MalwareBytes.

Both are free.

And if money isn't an issue then buy Avast Internet security and MalwareBytes Pro.

"what softwares do i need to install and keep running to make 110% sure that i wont get infected"
- Don't install any random shit.
- Make sure your Java is up to date.

shahwahababdul - June 4, 2016, 4:58 am

wow thanks buddy this one helped alot thank you very much but bro can you tell me something why is avast the choice dont get it because many crypters have issues with bypassing nod and avg so why is avast the choice???

will be waiting for your reply thanks

Link me to those crypters please.

It's on coders skills btw.

When someone uploads Trojan on distributing site, Avast is in the Top 5 Antivirus which updates it virus definition as soon as possible.

<http://www.eset.com/int/home/for-windows/>

Go for smart security.

BITW - June 4, 2016, 6:38 am

Use any of Total Securities provided by Eset or Bitdefender.

<https://hackforums.net/showthread.php?tid=5199646>

cant tell u exactly but giving you reference to LuminosityLink
cyberseal was not able to bypass avg

DarkEyE Protector V3 Basic was not able to bypass avg

BosonLight was not able to bypass avg kaspersky and avira

so as you can see these are i think top crypters (i think)
and you can clearly see that avast is priety easy to bypass

So what do you think???

lavish - June 6, 2016, 10:39 am

Kaspersky with a hint of Malwarebytes = Best protection IMO.

Kaspersky can be changed with Bitdefender, avast and others if you do not want to pay.

?

Damn never knew AVG is soo good.

Go for AVG.

SIM-2502833 - June 6, 2016, 10:50 am

Don't listen to any of these people. All of my stubs, the only detection is always ESET NOD32. They are by far the best.

Kaspersky detection system is completely based off the assembly and icon of the .exe -_-

Mr 4rs4l4ne - August 21, 2016, 10:51 am

Hello,

First, u need to know that AVs doesn't protect, but, they HELP

If u have a good Pc with good resources, go with Kaspersky total security

If u're looking for a lightweight and efficient AV, go with ESET Smart security, It's good with a good firewall too, 1 day, i was on coffee shop wifi connected, some skid launch ARP Poisoning for pass sniffing, My ESET firewall detect it with all the attackers info, i did a small research with NETCUT, i grabbed his pcs name, hostname, and mac adress too.

Forget about all the others CRAP, u knwo that the ultimate challenge for crypters, is to bypass ESET and kasp, those two are the first to detect the stubs.

Security is not with AVs, but with BRAIN .

Have a good day .
