Thread: [Play Mp3 song through microphone](#)

iPwned - June 19, 2016, 8:16 am

Alright, so I want to play music through out the microphone, it's for a game that I want to create the tool for.

I've found out that there is a tool that does this already <https://github.com/SilentSys/SLAM> But I'd love to get a smaller and easier snippet which I can learn from. I just want to play a simpe mp3 sound through a list of output recording devices or the active output device.

You literally have the source of a program that does it, get your snippet from there.

If I understood you right this is the thing you are looking for

```
Code My.Computer.Audio.Play("file.mp3")
```

And a microphone is something which is used to convert sound to electric signal , you dont want that you want the other way round.So that would be a headphone or speaker

No, in few games you can talk with your microphone, if you use a tool like SLAM (link in OP) you can play mp3 sound through the microphone so other player in the game would hear the song.

That's what I want to do!

So you just ignore my post which is the solution. I think since it requires you to do work which you don't want you ignore it because you want the code spoonfed. We won't spoonfeed you the code.

This. It does literally exactly what you want and it's really as basic of a source as you can get, nothing even remotely complex...
