Thread: [>> Free Hacking Programs << Hacking Vulnerability Exploitation Tools](#)

muroseu - June 21, 2016, 2:10 am

All information in this tutorial is for educational purposes only. One day when you grow up you might realise that you have been a skid, by using mass-deface techniques and SQLi for your entire life. Do not just hack a site because it is there.

Ethical hacking and online security involves a lot efforts. Many tools are used to test and keep software secure. The same tools can also be used by hackers for exploitation. Becoming a hacker is not easy it requires many skills. You can learn a few hacking tricks from free hacking tutorials online, some really cool hacking books and books on information security . However, Along with all the skills you need to have best tools to perform hacking, security threat analysis and penetration testing.

A hacking tool is a computer program or software which helps a hacker to hack a computer system or a computer program. The existences of hacking tools have made the lives of the hackers much simpler when compared to the times they did not exist. But it does not mean that if the Hacker is equipped with a good hacking tool, his entire job is smoothly done. The hacker still requires the skills of all the aspects of hacking equally well.

A tool which identifies whether a remote host is vulnerable to a security attack and tries to protect the host by providing a shell or other function remotely, is called a Vulnerability Exploitation tool.

Metasploit

Metasploit was released in the year 2004 and it was an instant hit in the world of computer security. Metasploit provides data on the vulnerabilities in the security system and it helps in conducting penetration testing too.

Sqlmap

It is a penetration testing tool which is available as an open source. Its goal is to automate the detection and exploitation process of the injection flaws in SQL and to take over the database servers.

Sqlninja

The main objective of this tool is to access a vulnerable DB server; it's used for pen testing so that the procedure of controlling a DB server can be automated when the vulnerability of an SQL injection has been tracked.

Social Engineer Toolkit

This tool kit also known as SET, was designed by TrustedSec. The tool comes as an open source code and is Python driven. It is used for conducting Penetration Testing around Social Engineer.

NetSparker

It is a web based security scanner which has an exploitation engine to confirm the security vulnerabilities and makes the user concentrate on elimination of security threats with its False-Positive free feature.

BeEF

BeEF is the short term for The Browser Exploitation Framework. It is a tool for penetration testing which concentrates on a web browser and thus accesses the actual security position of the environment it's targeting.

Dradis

Dradis stands for Direction, Range and Distance. It is an open source vulnerability scanner or application which provides the facility of information sharing effectively, especially during assessing the security of the system in a central repository.

I could only add a little, because 8000 letter limit.

I'm gonna make a thread for each one separately just so i can add pictures later on.

I'll be doing a different post on other subjects too. You can find all the posts in my Threads in my profile!

Please leave a comment what you think about this and hope you liked it!
