Thread: [>> Free Hacking Programs << Vulnerability Scanners](#)

muroseu - June 21, 2016, 2:14 am

All information in this tutorial is for educational purposes only. One day when you grow up you might realise that you have been a skid, by using mass-deface techniques and SQLi for your entire life. Do not just hack a site because it is there.

Ethical hacking and online security involves a lot efforts. Many tools are used to test and keep software secure. The same tools can also be used by hackers for exploitation. Becoming a hacker is not easy it requires many skills. You can learn a few hacking tricks from free hacking tutorials online, some really cool hacking books and books on information security . However, Along with all the skills you need to have best tools to perform hacking, security threat analysis and penetration testing.

A hacking tool is a computer program or software which helps a hacker to hack a computer system or a computer program. The existences of hacking tools have made the lives of the hackers much simpler when compared to the times they did not exist. But it does not mean that if the Hacker is equipped with a good hacking tool, his entire job is smoothly done. The hacker still requires the skills of all the aspects of hacking equally well.

The scanners which assess the vulnerability of a network or a computer to security attacks are known as Vulnerability Scanners. The tools might function differently, however all of them aim to provide an analysis on how vulnerable the system or a network is.

Nessus

Nessus is the world's most popular vulnerable scanner topping the list in the years 2000, 2003 and in the year 2006 survey on security tools. It's a free to use vulnerability scanner for personal use in the non enterprise environment.

OpenVAS

This scanner is tipped by many to be the most advanced vulnerability scanner in the world and is a powerful and comprehensive tool for scanning as well as providing solutions for vulnerability management. It is free software and is maintained daily.

Nipper

It is a parser for network infrastructure and its full form is Network Infrastructure Parser. This open source scanner helps with features like auditing, configuring and managing devices for network infrastructure as well as managing the computer networks.

Secunia PSI

It is free computer security software which scans software on a computer system. It tracks those third party/non Microsoft programs which requires security updates to protect your computer against hackers and cyber-criminals.

Retina

Retina, with more than 10,000 deployments, is one of the most sophisticated vulnerability scanners in the market. It aids in efficient identifications of IT vulnerability and is also available as a standalone application as well. It essentially identifies weaknesses in the configuration and missing patches.

QualysGuard

It is a vulnerability management scanner which provides solutions for vulnerability management by applications through the web. Designed by Qualys Inc., it's available on demand. It helps the users by analyzing their vulnerability status.

Nexpose

Vulnerability management is one of the best security practices to protect the system or a network from security threats. Nexpose is a vulnerability management scanner which does different kind of vulnerability checks where there's a risk in IT security.

I could only add a little, because 8000 letter limit.

I'm gonna make a thread for each one separately just so i can add pictures later on.

I'll be doing a different post on other subjects too. You can find all the posts in my Threads in my profile!

Please leave a comment what you think about this and hope you liked it!

Im attempting to use OpenVAS, as the book Im reading is using it, and I always run into this error when I start a scan. It starts the scan, gets to 1% then just says internal error and stops scanning. I have set up OpenVAS right, and the setup-check returns no issues, so Im dumbfounded on what the problem is.

ANY help is appreciated!
