Thread: [DeathByCaptcha \[AutoIT\]\[Possible?\]](#)

Conscious - June 22, 2016, 3:23 am

Hi everyone.

I never used deathbycaptcha before so I am not sure how it works.

but I need DeathByCaptcha for a Recaptcha bypass in one of my autoIT scripts.

I made a script for a buddy that automatically

Goes to website, inputs Name/Email/Password, press sign up.

But there is a recaptcha so obviously it says "Wrong Captcha"

How would I implement DBC to bypass it in AutoIT.

Never seen it being done before so i'd love some help.

Thanks in advance.?

HTML(Had to remove <> or else I got security error):

```
div class="field captcha"
    div class="recaptcha" /div
    p class="error-message red" /p
/div
```

My code so far:

PHP Code

```
<?php
```

```
Local $emails = "email.txt" ;sets file path
```

```
Local $pwd = "pwd.txt" ;sets file path
```

```
Local $name = "name.txt"
```

```
Local $ArrayEmail, $ArrayPwd, $ArrayName ;declares array
```

```
_FileReadToArray($emails, $ArrayEmail) ;converts file to array
```

```
_FileReadToArray($pwd, $ArrayPwd);converts file to array
```

```
_FileReadToArray($name, $ArrayName);converts file to array
```

```
Local $url= "https://urlhere/signup"
```

```
Local $oIE = _IECreate($url, 1)
```

```
$tags = $oIE.document.GetElementsByTagName("a")
```

```
For $tag in $tags
```

```
$class_value = $tag.GetAttribute("class")
```

```
If string($class_value) = "signup-email" Then
```

```
    $oCorrectObj = $tag
```

```
    ExitLoop
```

```
EndIf
```

```
Next
```

```
If IsObj ( $oCorrectObj ) Then
```

```
_IEAction ($oCorrectObj, "click")
```

EndIf

```
Local $name = _IEGetObjByName ($oIE, "name")
Local $email = _IEGetObjByName ($oIE, "email")
Local $password = _IEGetObjByName ($oIE, "password")
For $i = 1 to UBound($Arrayemail) -1
    For $e = 1 to UBound($Arrayemail) -1
        For $b = 1 to UBound($ArrayPwd) -1
            _IEFormElementSetValue($name, $ArrayName[$i])
            _IEFormElementSetValue($email, $Arrayemail[$e])
            _IEFormElementSetValue($password, $ArrayPwd[$b])
```

```
$tags1 = $oIE.document.GetElementsByTagName("input")
For $tag1 in $tags1
    $class_value1 = $tag1.GetAttribute("class")
    If string($class_value1) = "btn left" Then
        $oCorrectObj1 = $tag1
        ExitLoop
```

```
EndIf
Next
Sleep(10000)
If IsObj ( $oCorrectObj1 ) Then

    _IEAction ($oCorrectObj1, "click")
```

```
EndIf
Next
Next
Next
```

Still no one??

Hope someone can assist me.

Do they have an API system? Try looking into it and send POST/GET request using COM object
