Thread: [Highly Advanced Recommended Security System](#)

AcroClipz - June 24, 2016, 6:20 pm

HackForum Members. I'm clearly not an high-ranked HF member but believe me that 90 percent of all both the high-ranked and low-ranked HF members does not really know a damn thing of what the hell they're talking about when it comes to Net Security and Anonymity as i've seen proof of members on HF using Windows 10 as their main Operating System and the original Firewall along with the original Antivirus Protection and nothing else but yet they still sit and talk bullshit as they recommend other users of HF their methods of keeping a Computer Safe and Secure with an Anonymous Identity. This is completely bull-shit. I truly hope none of you trust what ever bullshit security, privacy & anonymity softwares and/or tools that they tell you about without actually doing your own research about them.

I do HIGHLY recommend using DarkNet to gather information on the latest top security systems, tools and softwares from awarded advanced net users and websites and before you enter the DarkNet I also HIGHLY recommend you do some research on the WhiteWeb about security, privacy & anonymity as these subjects are NOT easy to archive as it really does not matter what type of level on security you use as this is only here to help us and not anything else, you'll have to do the research yourself about this and figure out a suitable type and/or level of security, privacy and anonymity based on your online habits along with what type and/or level of security you are looking for yourself and your devices.

I recommend the following for myself --->

- 1.) Windows 8.1 OS (Gaming) Tails OS (Computer Use)
 - 2.) Bitdefender Internet Security (System Security Software)
 - 3.) Blancco Computer Data Eraser (Data Destruction Software)
 - 4.) System Mechanic Pro (System Maintenance Software)
 - 5.) HitmanPro.Alert (Anti Malware Software)
 - 6.) SpySheltet (Anti Keylogger Software)
 - 7.) Strixus Firewall (Mostly Advanced Cyber-Security Software)
-
- 1.) Sigaint Mail / MyMail / Protonmail (Anonymous & Private Email Providers)
 - 2.) Kali Linux (Advanced Penetration Testing Tool)
 - 3.) Nessus (Network Vulnerability Scanner)
 - 4.) Wireshark (Network Protocol Analyser)
 - 5.) Snort (Network Intrusion Detection System)
 - 6.) Netcat (Network Utility Tool)
 - 7.) VCPoVPN (Anonymous DarkNet SSH/SSL VPN)
 - 8.) Tor Browser (Anonymous DarkNet Web Browser)
