Thread: [Need Help Connecting my Domain](#)

Elliot Alderson. - June 30, 2016, 4:52 am

Need help connecting my domain to a Debian 7 VPS

If you can help me shoot a PM and add my skype

I'll probably pay you as it will be a big relief

Im running apache2 btw.

Are you running any sort of Panel on your VPS or is it all through SSH?

You need to run nameservers on your VPS. Most people go with a BIND configuration.

You set up 2 nameservers, and connect your IP (assuming 198.23.151.176 from your other thread) to them. Ideally you'd have 2 IPs, but 1 is fine too.

Once you have 2 nameservers available for use, you go into your domain's settings on your registrar and add the 2 nameservers there in the DNS settings.

The easiest way to do this would be through a panel such as WHM. If you don't have a panel available, you'll need to manually set it up. Here's a guide on how to setup [BIND on a Debian server](#).
