Thread: [Need urgent help. Extracting data from multiplt databases.](#)

delhiar - July 4, 2016, 9:02 am

I found a website which i exploited using havij.

and there are 150+ wordpress databases on that server.

and user names are stored in "database>WP_user>User_Login, user_pass

if i manually open each database and extract user name and pass then it gonna take forever.

is it possible to automate this? so that i can get data in somewhat this format "Database Name : User : Pass "

it would be great help.

p.s. i'll crack phpass hashes myself.

...

Yes, it is. See my [challenge 20](#)

In PM I am showing you alternative semi automatic way how to do it (not to spoil my own challenge)
?
