Thread: [\[UPD: 05/19\] \[Massive\] A Comprehensive Remote Administration Guide](#)

Purple Kief - July 4, 2016, 10:16 am

What I ask of you

Spoiler ([Click to View](#))

I believe my guide is finished but there is still room for improvement.

I might have missed something or posted some wrong information. (very unlikely)

Please leave your suggestions as comments below so I can possibly add them.

Aside from that, I spent A LOT of time on this guide. I kindly ask that you spread it around to people that want to learn about RAT's.

99% of the time this will hold more for them than your 1 - 5 line comment.

Thank you:

- Eternal: for giving me a 1 month code to use for the tutorial. (143VPN)
- French crypter: for giving me a 10 days code to use for the tutorial. (Static Crypt)
- Cibor: for giving me a 1 day code to use for the tutorial. (Ozone)
- ShockWave: for giving me a lifetime code to use. (Imminent Monitor 4.3)
- no\$fera\$tu: for giving me a 24h code to use for the tutorial. (Data Protector V4)
- Revcode: For the 72h trial account on your site. (Revcode Webmonitor)

Introduction + Goal

Spoiler ([Click to View](#))

Hello HF community, thanks for making it over to my thread. Are you tired of the same questions being explained over and over again? 10 billion links that you can find all over the place that lead to all over the place?

No more. I'm writing everything that's within my knowledge down in this massive thread. The goal here is to have 1 massive RAT hub that people can come to to find anything, let's see if we succeed.

I encourage you to leave anything I missed/suggestions in the comment since I plan on updating this A LOT!

Index

Spoiler ([Click to View](#))

Since it's hard to have an index in a page filled with spoilers I'll have a color index.

This'll help you navigate at least a tiny bit.

-- General --

-- Port Forwarding Related --

-- Crypting related --

Things you NEED to know about a RAT

Spoiler ([Click to View](#))

- a RAT is legal software and is not meant to be used in any malicious way. If you do use it in a malicious way you are at constant risk of losing your license and going to jail.

- Your clients will not disappear after you or them have restarted their computer. (providing you used startup which I explain later on in the guide)
- Most RATs are HWID locked meaning you can only use 1 computer per license. Don't try and share it with your friends. Orcus is an exception and allows 3 per license.
- You can have user or administrator permissions on your clients, changing the amount of things you can do drastically.
- Unless you are using a PHP RAT you will ALWAYS require port forwarding.
- Certain RATs have dependencies while others don't. Explained more in-depth later on.

Things you NEED to know about using a crypter

Spoiler ([Click to View](#))

- A crypter is legal software and is not meant to crypt malware with. Doing this you always run the possibility of your license being banned.
- Crypters are not magic, it's not as simple as drop in a .exe and have it come out FUD.
- If you are getting 8+/35 detections don't go crying to the owner. They can be fixed by you if you follow the guide later on.
- Ticking every single option in your crypter is a good way to corrupt your RAT beyond using.
- There's a difference between scantime and runtime. Scantime is the result of your file being scanned without it being executed on a PC. Runtime is the result of it being scanned while it's running on your clients PC. (Making it much easier to detect and making scantime useless)
- Don't EVER double up on settings in both your RAT and crypter. Nothing good comes from that.
- THE CHEAPER THE CRYPTER THE BETTER THE QUALITY IS NOT THE RIGHT ATTITUDE.

Port forwarding

Spoiler ([Click to View](#))

Port forwarding, most of you guys usually go DEAR GOD HELP ME when you are confronted with this. WELL NO MORE! After this guide everyone should be able to port forward with or without VPN. Why do you need to port forward? You need an open port for outside connections (your client) to connect to your internet. Well, let's get into the without VPN part first.

Understand the following BEFORE going onto this guide.

- Googling your router and how to port forward on it will NEVER hurt. They give information that is impossible for me to know in advance such as what you need to click on etc.
- There's a couple different router setups. I'm going to cover the ones I know which is a total of 3 ways. It's up to you to figure out which one of these is closest to yours.
- Even when you THINK your port forwarding is done, keep on reading and don't miss a SINGLE step!

Possible setup no. 1 - Regular portforwarding

This is the easiest to do and also the most common among routers.

Go over to your router page found by typing in your default gateway into your browser.

How do you find your default gateway? Open your cmd.exe and type in ipconfig which will show you your default gateway 2 lines below your IPv4.

In the picture below my default gateway is 192.168.0.1.

Now that you are on your router page you will want to find the port forwarding tab.

Usually this can be found under the advanced tab and is straight up called 'port forwarding'. Once you've found it, click on it and you should see something similar to this.

Now don't get scared by the different language shown here. Let me quickly explain in order what those words mean. What you're looking at is Internal IP-adress / Begin port / End port / Protocol / Activated.

Your internal IP adress is your IPv4 shown above your default gateway. Your begin port and end port should be the same and is the port you are trying to open. Protocol is either UDP or TCP or BOTH. You will want to choose BOTH!
Now that you know all this, this is what it should look like filled in. (In this picture I have opened port 30000)

When you filled in yours and it looks like mine (with your IPv4 and desired port) hit save changes and that concludes port forwarding. Read the 'testing your port' category on how to PROPERLY test your port. DON'T TEST IT ON YOUR OWN, GO READ THAT SECTION!

Possible setup no. 2 - Service/Virtual Server
This one is a bit different from your usual port forwarding but is pratically still the same. Port forwarding won't be called port forwarding on your router but it'll be called 'service/virtual server' honestly there's no difference here other than the name.

Let's start off with the usual.
Go over to your router page found by typing in your default gateway into your browser.
How do you find your default gateway? Open your cmd.exe and type in ipconfig which will show you your default gateway 2 lines below your IPv4.
In the picture below my default gateway is 192.168.0.1.

Once you are on your router page navigate towards create a service/virtual server. Something similar to this will show up.

Now don't get scared by the different language shown here. Let me quickly explain in order what those words mean. What you're looking at is Internal IP-adress / Begin port / End port / Protocol / Activated.
Your internal IP adress is your IPv4 shown above your default gateway. Your begin port and end port should be the same and is the port you are trying to open. Protocol is either UDP or TCP or BOTH. You will want to choose BOTH! If it asks you for a service name you can type in whatever, just make sure that you remember it!
Now that you know all this, this is what it should look like filled in. (In this picture I have opened port 30000)

Now that you've filled it in and everything is correct hit 'save changes'. Now this is where your port forwarding is different from the usual. Once you've hit save changes you will want to navigate over to your router's firewall. (Usually found somewhere in security/basic settings)
-----ADD PICTURE -----

Here it will give you the option of letting a service through the firewall. You will want to add the service you just created and let it through the firewall or your port will remain CLOSED.

Usually this is done by clicking add, choosing the name of the service and then defining if you want to let it through or not. You will want to allow it and that concludes your port forwarding. Read the 'testing your port' category on how to PROPERLY test your port. DON'T TEST IT ON YOUR OWN, GO READ THAT SECTION!

----- ADD PICTURE -----

Purple Kief - July 4, 2016, 10:17 am

Port forwarding (VPN)

Port forwarding through a VPN is way easier and simplified.

It is also HIGHLY recommended that you use one regardless of your intentions. Due to it being way simpler I can just make steps instead of complicated and long explanations.

CrypticVPN

Spoiler ([Click to View](#))

- Connect to the server you wish to use.
- Go to the crypticvpn.com website, log in and navigate to the VPN control panel and from there to the 'open port' section.
- In port fill in the port you wish to open. (recommend any port between 10k and 60k)
- Internal IP is your IPv4 which should start with 10.8 if you are properly connected to the VPN. (Keep in mind you have multiple IPv4 make sure you get the right one!)
- Location will be the server you are currently connected to.
- In the picture below you will see me open port 12521 on the amsterdam servers.
- That concludes port forwarding through crypticVPN. Read the 'testing your port' category on how to PROPERLY test your port. DON'T TEST IT ON YOUR OWN, GO READ THAT SECTION!

Ra4wVPN

Spoiler ([Click to View](#))

- Connect to the server you wish to use.
- Go over to the ra4wvpn.com website, login and navigate to where you open ports.
- ----- ADD PICTURE -----
- In port fill in the port you wish to open. (recommend any port between 10k and 60k)
- Internal IP is your IPv4 which should start with 10.8 if you are properly connected to the VPN. (Keep in mind you have multiple IPv4 make sure you get the right one!)
- Location will be the server you are currently connected to.
- In the picture below you will see me open port 12521 on the XXXXX servers.
- ----- ADD PICTURE -----
- That concludes port forwarding through ra4wvpn. Read the 'testing your port' category on how to PROPERLY test your port. DON'T TEST IT ON YOUR OWN, GO READ THAT SECTION!

143VPN

Spoiler ([Click to View](#))

- Connect to the server you wish to port forward on.
- Go to 143vpn.com and click 'port forwarding' at the top right.
- Log in using your VPN info, not the login for the website itself!
- You should now be on this page.

- Choose any port between 10 - 60k
- The internal IP address is your IPv4 which you can find by opening your cmd.exe and typing in 'ipconfig' without the ". It should start with 10.8.
- Keep in mind you have multiple IPv4 so make sure you get the right one!
- Choose the server you're connected to and hit 'submit'.
- If done correctly you should see this.

- That concludes port forwarding through 143VPN. Read the 'testing your port' category on how to PROPERLY test your port. DON'T TEST IT ON YOUR OWN, GO READ THAT SECTION!

Testing your port

Open the spoiler of your RAT below for further instructions on how to check your port.

PAID

Orcus

Spoiler ([Click to View](#))

- Connect to your VPN if you are using one. If not skip this step.
 - Completely disable your firewall! (VERY IMPORTANT)
 - Open orcus main administration and click on 'create a new server'.
 - IP-adress is your IPv4 and port is the port you opened. When you filled those in hit 'add'.
- Password can be whatever you choose.
- This is what the end result should look like. (using your own IPv4 and port)
 - When you've achieved that end result click 'build' and save that server somewhere.
 - Open the server and you should see the following. (with your own IPv4 and port)
 - Now the server is running go to canyouseeme.org and fill in the port you opened.
 - It should say succes if done properly

RevCode Webmonitor

Spoiler ([Click to View](#))

You don't have to port forward. Yeah you can enjoy that.

Imminent Monitor 4.3 (c# port)

Spoiler ([Click to View](#))

- Connect to your VPN if you are using one. If not skip this step.
- Completely disable your firewall! (VERY IMPORTANT)
- Open Imminent Monitor.
- Click on settings.
- Right click in the open field and click on add port.
- When you've added the port you opened at the bottom right click on 'start listening'.
- The status which previously showed as 'idle...' should now say 'listening!'.

- Once you've done that go to canyouseeme.org fill in the port and if it says success your port is opened correctly!

Purple Kief - July 4, 2016, 10:18 am

FREE

[njRAT](#) <-- CLICK TO DOWNLOAD! PW: Neos07

Spoiler ([Click to View](#))

- Connect to your VPN if you are using one. If not skip this step.
- Completely disable your firewall! (VERY IMPORTANT)
- Open njRAT
- As soon as it opens you'll want to enter the port you opened and then hit 'start'.

- Once you've done that go to canyouseeme.org fill in the port and if it says success your port is opened correctly!

google.com/open?id=0B5hJO7YTHi-hc2VqbG8zMFdPREUJBabylon <-- CLICK TO DOWNLOAD!

PW: #4k53m4sdFGUMSDKFGk45tmkSDKM%l"&#p&fsdkfmF4

Spoiler ([Click to View](#))

- Connect to your VPN if you are using one. If not skip this step.
- Completely disable your firewall! (VERY IMPORTANT)
- Open babylon.
- At the top hit 'file' then hit 'settings'
- Right click and hit 'clear' the list will now be empty.
- Right click and hit 'add port'. Fill in the port, when it asks you for a network key fill in whatever you want but make SURE you remember it! The Address Family is 2.
- This is what it should like if done correctly.
- Hit save and save the file in the same folder as babylon.
- Then hit load and load the file you just saved.
- Go back to the main babylon client hit 'file' and then hit 'start server'.
- You should see this (with the port you specified)
- If it shows that go to canyouseeme.org fill in the port and if it says success your port is opened correctly!

[Quasar](#) <-- CLICK TO DOWNLOAD

Spoiler ([Click to View](#))

- Connect to your VPN if you are using one. If not skip this step.
- Completely disable your firewall! (VERY IMPORTANT)
- Open Quasar.
- At the top hit 'settings'
- It'll ask you for a 'port to listen too' fill in the port you opened there.
- Once you've done that hit 'start listening'
- Once you've done that go to canyouseeme.org fill in the port and if it says success your port is opened correctly!

Darktrack

Spoiler ([Click to View](#))

- Connect to your VPN if you are using one. If not skip this step.
 - Completely disable your firewall! (VERY IMPORTANT)
 - Open Darktrack
 - Click on client settings
 - In port no fill in your open port, password can be whatever you please.
 - Once you've done that click the little '+' next to where you filled in the port and you should see this
- Once you've done that go to canyouseeme.org fill in the port and if it says success your port is opened correctly!

What RAT should I buy/use?

I'm so tired of seeing these threads that I'm just going to implement a little review in this one. It'll be based on popularity and what I've personally read about that RAT.

PAID

Spoiler ([Click to View](#))

LuminosityLink

Spoiler ([Click to View](#))

Public opinion

- + User friendly
- + Easy to use
- + Stable
- + Excellent support
- Has a .NET dependency
- Has a region lock

Personal opinion

I feel like KFC has a nice program but it's simply out-matched by other RATs sold on the market currently. It does not help that he implemented a region block making blackhat use (looking at you reading this) pretty much impossible.

Which used to be my favorite RAT now scores at about 6.5/10.

Orcus

Spoiler ([Click to View](#))

Public opinion

- + Not so user friendly
- + Easy to use, hard to setup
- +/- Stable for some, less stable for others
- + Excellent support
- Has a .NET dependency

Personal opinion

I think Orcus is going in a straight line forward. Armada is doing his best managing the product and

to my knowing Sorzus (the developer) is still working hard to improve it. If you like the feel that Orcus has then you're not making a mistake buying Orcus. Keep in mind more so than other RATs Orcus depends on .NET 3.5 which is not the same as 2.0.

I'll give Orcus a 8.5 for the really high customizability and Armada being a sausage.

Imminent Monitor 5

Spoiler ([Click to View](#))

Public opinion

- + Very stable
- + Insanely good UI
- + Good customer support
- + User friendly
- Has a .NET dependency

Personal opinion

I think Imminent Monitor is currently the top RAT sold on HF. Shockwave is a highly experienced developer and has been working on Imminent Monitor for 5 years+.

Other than Shockwave sometimes getting a bit lazy (don't we all) I really can't say anything bad about this RAT.

Going to give Imminent Monitor a well deserved 9.5/10. Not a 10 remember when it comes to coding, nothing is perfect.

RevCode Webmonitor

Spoiler ([Click to View](#))

Public opinion

- + No portforwarding
- No customizability for your client file (DNS/Hidden is missing)
- + - More information pending

Personal opinion

There's 2 things I can see straight from the bat.

- User friendliness is ridiculous. There is no setup, literally nothing.
- This software is straight whitehat. There will ALWAYS be a double installation dialouge.

Overall I think this software is great if you're dealing with a less technical person. This would be a perfect recommendation for a dad/mom for example.

I would like to make clear though that the remote desktop stream seemed quite slow, even on a local connection. If you're all about that sweet FPS this web RAT is not for you.

FREE

Spoiler ([Click to View](#))

njRAT

Spoiler ([Click to View](#))

Public opinion

- + Decently stable
- + Easy to use
- No support
- Password recovery is broken (there's a fix on HF tho)
- Has a .NET dependency

Personal opinion

njRAT is the first RAT I ever used and I don't really have many complaints about it. For a free RAT I'm honestly impressed with how stable it is. Using it back when I was a noob probably using all the wrongs settings I managed to hold clients for 1 - 2 weeks. The remote desktop is decently fast too, overall it's my favorite free RAT.

My overall rating for this RAT is 7/10

Darktrack

Spoiler ([Click to View](#))

Public opinion

- Not so stable
- + - Easy to use, little harder to setup (without a guide)
- + - Support (touch and go)
- + No dependencies
- Early stages = bugs

Personal opinion

First time I set up this RAT I immediatly encountered a bug. Being experienced I decided to ignore it and it did indeed turn out to just be a visual bug. Other non-experienced members might have spent 30 min - 1h trying to fix it even tho there was no real bug there. Aside from that I heard it's not stable yet, people are losing their clients when closing the program etc. It's got a couple of cool features like the skype monitor thingy but aside from that I'm not convinced yet. (don't release something that isn't ready)

My overall rating for this RAT is 4/10

Babylon

Spoiler ([Click to View](#))

Public opinion

- + - Sorta stable
- + Easy to use
- No support
- Webcam capture is not fully programmed although it works for most
- + Has no dependencies

Personal opinion

Babylon is probably the most recommended free RAT currently available. (together with Darktrack) My friend used to use it a lot and watching him use it it seems like an OK program. I did see him loose clients every now & then so that's worth noting. Aside from that the program works as advertised and is not bad at all.

My overall rating for this RAT is 6/10

Purple Kief - July 4, 2016, 10:19 am

Setting up a DNS

Spoiler ([Click to View](#))

Why do you need a DNS? Fact is that you don't NEED a DNS. But if you don't have one and your IP changes all of your clients will be gone. You don't want that now do you?

Yeah that's what I thought. Now there's 2 free DNS providers and 1 paid provider that are now accepted on HF.

FagDNS found at fagdns.su (FREE)

freenom found at freenom.com (FREE)

Armada's DNS found <https://hackforums.net/showthread.php?tid=4995393> (RECOMMENDED)

I can't help you set up Armada's DNS but the instructions he gives you are more than clear. Well, let's get onto setting up the free DNS alternatives.

Freenom - Free DNS (Full credit to Neos for the pictures)

- If you plan on using a VPN connect to it right now. If not skip this step.
- Head over to freenom.com and check for an available domain.
- Take one of the free ones and click on 'get it now!'
- At the right select the period you want to get it for. (You can choose upto 1 year for free!)
- As with any website you will be asked to register an email and all the other stuff. You can use random information but make sure you have access to the email!
- Now that you have your domain head over to this link.
<https://my.freenom.com/clientarea.php?action=domains> (You can navigate there by clicking on domains --> my domains)
- There you will want to click on manage domain followed by manage freenom DNS.
- Here you will be greeted by the following.
- You can leave everything here as the default setting. The only thing you need to change is the target.
- The target will be the IP shown at canyouseeme.org
- Fill in that IP as the target and hit save changes. Your DNS will now be active after 10 - 20 minutes!
- You've successfully created a DNS! After waiting 20 minutes you can go onto testing. Read the testing your DNS section to check if your DNS was created properly!

Testing your DNS

Spoiler ([Click to View](#))

You've created your DNS! Congrats man. Now let's see if it's actually working properly.

- Open your command prompt and type in the following command.
- ping 'yourdnswhere' without the "
- If you see the following but with your IP there then your DNS is working properly!

Setting up a RAT

Read the 'testing your port' and 'testing your dns' section before going onto this!
So you've port forwarded and set up a DNS and are ready to embark on the RAT adventure?

PAID

Orcus

Spoiler ([Click to View](#))

- Connect to a VPN if you are using one if not skip this step.
- Start by opening the Orcus server you made in the 'testing your port' section.
- Open Orcus main administration.
- IP = Your external IP found at canyouseeme.org
- Port = Your open port which you configured in the orcus server.
- Password = Your password which you configured in the orcus server.
- Hit connect and you are now logged into your Orcus. You can now go into building a binary.

Every RAT is basically pre-configured. All that's left to do is build your binary.
Due to the max. amount of images some of these will be links instead. My apologies for this.

General settings - Enable what you feel like.
Connection

Protection - Enable what you feel like.
Installation

Assembly information - Fill in if you want.
Plugins - Use what you want to use.
Build - Enable orcus patcher if you're not testing! Leave it disabled if you're testing.

RevCode Webmonitor

Spoiler ([Click to View](#))

Log in on their website <https://yourusernamehere.revcode.eu/index.php> and click on 'Client'.

Install = Will make sure the client comes back upon restarting their computer. Enable if you want.
Persistence = Will prevent closure of the client process. Enable if you want.

Click on 'Generate & Download' and EXTRACT your client file (.exe) to your desktop.
Your file is now ready to be sent to your clients.

Purple Kief - July 4, 2016, 10:21 am

Imminent Monitor 4.3 (C# port)

Spoiler ([Click to View](#))

THINGS TO NOTE:

- Everything in module protection is your own choice.
- I personally recommend only using hide file + registry persistence.
- Everything in assembly information is optional and not necessary.
- In compile settings make sure hidden mode is ENABLED.

Imminent's startup

FREE

njRAT

Spoiler ([Click to View](#))

Every RAT is basically pre-configured. All that's left to do is build your binary.

Due to the max. amount of images some of these will be links instead. My apologies for this.
njRAT's startup.

Crypter's startup.

Babylon

Spoiler ([Click to View](#))

Every RAT is basically pre-configured. All that's left to do is build your binary.

Due to the max. amount of images some of these will be links instead. My apologies for this.

(What does Personal mean? It's whatever you filled in when adding the port, varies for everyone)
Babylon startup. (Just click build when you have the settings from the pictures below)

Crypter startup. (LEAVE EVERYTHING ELSE DEFAULT SETTINGS)

Quasar

Spoiler ([Click to View](#))

Every RAT is basically pre-configured. All that's left to do is build your binary.

Due to the max. amount of images some of these will be links instead. My apologies for this.

Quasar's startup.

- Open your builder. Go to the 'connection settings' tab.
- Fill in your DNS in IP/hostname and your open port in Port.
- Click 'add host' and you should see this.

- In the 'installation' tab tick 'install client' and 'run client when the computer starts'. (Feel free to use whatever settings you like just make sure you have those 2 enabled)
- Assembly and surveillance settings are your personal choice.
- When you've gone through all tabs click 'build'.

Crypters startup.

- Open your builder. Go to the 'connection settings' tab.
- Fill in your DNS in IP/hostname and your open port in Port.

- Click 'add host' and you should see this.

- In 'installation settings' make sure EVERYTHING is disabled.
- Enable the keylogger from the 'surveillance' tab if you want.
- Click build.

Darktrack

Spoiler ([Click to View](#))

Every RAT is basically pre-configured. All that's left to do is build your binary.

Due to the max. amount of images some of these will be links instead. My apologies for this.
Darktrack's startup.

- Click on 'create server' right click on profiles and add a profile.
 - Double click that profile then click on 'connection settings'.
 - Click 'add IP adress' and fill in your DNS.
 - At the right you have 3 boxes. Top = Your open port. Middle = Your password (configured in client settings) Bot= Client ID
 - Fill in those boxes and you should have this.
-
- Go to the 'installation' tab and tick both 'installation' and 'startup'. (change whatever you want just make sure you have those 2 settings enabled!)
 - Go to the 'additional' tab and tick persistant server if you so choose.
 - Go to the 'security' tab and tick what you want. (I recommend only using Anti VM-ware/PC/Virtualbox)
 - Go to the 'build' tab and DON'T use the UPX option. Just click build and you are done.

Crypter's startup.

- Click on 'create server' right click on profiles and add a profile.
 - Double click that profile then click on 'connection settings'.
 - Click 'add IP adress' and fill in your DNS.
 - At the right you have 3 boxes. Top = Your open port. Middle = Your password (configured in client settings) Bot= Client ID
 - Fill in those boxes and you should have this.
-
- Disable EVERYTHING in every other tab and build your file in the 'build' tab. (DON'T TICK THE UPX OPTION)

How to test your stub properly

Spoiler ([Click to View](#))

What do you mean? Test it properly?

Well, using the wrong IP inside of your builder usually leads to no connection. As most of you might think there's multiple IP's to use in multiple situations. You can find them down below.

BUILD YOUR STUB ACCORDING THE 'SETTING UP YOUR RAT' SECTION!

A lot of you are testing your stubs the wrong way, making you think things are broken while that might actually not be the case. Here's how you test your stub properly. (All of this assumes you are running your RAT on your actual pc and not somewhere else)

Where am I testing my stub?

- 1) On the same computer you're running your RAT on.
- 2) On a VM on the same computer that you're running your RAT.
- 3) A different computer in the same network.
- 4) An outside computer outside of your network.

What IP do I need for that?

- 1) SAME COMPUTER = localhost or 127.0.0.1
- 2) VM SAME COMPUTER = Your IPv4 or when using a VPN your public IP (found at canyouseeme.org)
- 3) Different computer same network = Your IPv4 or when using a VPN your public IP (found at canyouseeme.org)
- 4) Computer outside of your network = Your public IP found at canyouseeme.org or your DNS.

Couple of examples.

- 1) Testing on my own computer --> <https://gyazo.com/26352d88a01457884aa949c5a32949e6>
- 2) Testing on my own VM (no VPN) --> <https://gyazo.com/6b9590b953c96285083efb9894c1aea2>
- 3) Testing outside of network --> <https://gyazo.com/2f3586ac057ed84882e55c3e2681d07c>

HELP NO CONNECTION!!

Calm down, don't panic. This guide WILL have the fix you're looking for but start by checking the following:

- Is my stub crypted? Always test connections uncrypted! This way you'll know if it was your crypter that broke the stub or not.
- Did my AV remove it? It might not look like it, but this is the case 95% of the time. Go check if the process is actually running.
- Am I being a dumbo? Did you misread a portion of my guide? It's very possible, go read over it again.

Common RAT settings explained (open for suggestions)

Spoiler ([Click to View](#))

- Installation/Startup: Required for your client to come back after he restarts his computer.
- Persistence/Respawn/Critical Process/: Will protect your process from being killed in the task manager.
- Mutex: It's a key preventing other RATs with the same key to run on that system. (To make sure you never run your RAT twice on accident)
- Anti Virtual Machine/VM: Prevent your RAT from being run on a virtual machine.
- Silent/Hidden mode: Required to prevent your client from noticing that your RAT is running.
- Melt: Your file will be removed when executed. (The original, not your startup process)
- Request elevation: Will request administrator permissions from your client.
- BSoD: Will generate a blue screen of death upon trying to kill your process.

Common crypter settings explained (open for suggestions)

Spoiler ([Click to View](#))

- Inject into: Will inject your 'RAT' inside of an already existing process.

- Startup/Installation: Required for your client to come back after he restarts his computer.
- Binder: Bind an already existing file to your RAT which will open at the same time. (ex: Pictures)
- Icons: Used to change the icon from your .exe (basically a MUST)
- Assembly: Used to change the assembly from your .exe (basically a MUST)
- Melt: Your file will be removed when executed. (The original, not your startup process)
- Fake error: Will generate a fake error of your choosing to show once your file is ran.
- Extension spoofer: Allows you to spoof the extension of your .exe (not recommended to do this)

Purple Kief - July 4, 2016, 10:21 am

Crypting your RAT

Make sure you've read setting up your RAT before going onto this!

Cyberseal

Spoiler ([Click to View](#))

Dear god, crypting. Nightmare of many, including myself.

Sadly there's no easy way to go about it, keep trying and you'll get it FUD sometime!

- First of all you will need to figure out if you're using your crypters startup or not.
- It's usually always recommended to do this, but remains your own choice. (in most cases)
- Let's say you're crypting a .NET based RAT. (Ex. Luminosity, Orcus, Nanocore) you are confined to using the 'inject into self' option if you plan on using your RAT's startup. (Your file is likely to corrupt if you don't do this)
- If you plan on using your crypters startup or are crypting a native RAT you can use other injection methods although I myself don't personally recommend it.
- Now that you've read all of that let's get onto crypting.

RAT startup.

(I'm crypting Luminosity here for anyone wondering)

- Open up Cyberseal and choose the file to be crypted.
- Tick 'itself' and injection method I personally like to use polymorphic stairs.

- Head over to the 'options' tab.
- Here you will want to choose an icon for your file. CREATE YOUR ICON USING THE FOLLOWING TUTORIAL: <https://hackforums.net/showthread.php?tid=5182868>
- When you've created the icon as described in the guide click 'browse' and add the icon to your file.
- Now go over to the 'assembly' tab.
- At the bottom you will see 'clone assembly' click that and clone the assembly from an existing legitimate program. (Honestly this is the part which makes crypting hard)
- You're done. Click seal and go scan your file on scan.majyx.net
- Is your file not FUD? Try different assemblies, the problem does NOT lie with your icon.
- Tried bunch of different assemblies but can't find one that works?
- Instead of changing assemblies keep the same assembly and bump your file by 20 - 60kb. (done in the options tab)
- Crypt, not FUD? Bump by 60 - 100kb, crypt. Not FUD? Bump by 100 - 160kb and repeat until it's FUD.

Crypter startup.

(I'm crypting Luminosity here for anyone wondering)

- Open up Cyberseal and choose the file to be crypted.

- Tick 'itself' and injection method I personally like to use polymorphic stairs.
- Head over to the 'options' tab.
- Here you will enable startup. Enable it and choose the folder for your file to be dropped in. (I personally prefer appdata)
- You will also want to choose an icon for your file. CREATE YOUR ICON USING THE FOLLOWING TUTORIAL: <https://hackforums.net/showthread.php?tid=5182868>
- When you've created the icon as described in the guide click 'browse' and add the icon to your file.
- Now go over to the 'assembly' tab.
- At the bottom you will see 'clone assembly' click that and clone the assembly from an existing legitimate program. (Honestly this is the part which makes crypting hard)
- Now head over to the 'others' tab.
- Here you will enable your persistence. Choose either BSoD or the regular persistence. It's not recommended to use both and I prefer the regular persistence personally.
- It's recommended to have a delayed execution altho not necessary.
- You're done. Click seal and go scan your file on scan.majyx.net
- Is your file not FUD? Try different assemblies, the problem does NOT lie with your icon.
- Tried bunch of different assemblies but can't find one that works?
- Instead of changing assemblies keep the same assembly and bump your file by 20 - 60kb. (done in the options tab)
- Crypt, not FUD? Bump by 60 - 100kb, crypt. Not FUD? Bump by 100 - 160kb and repeat until it's FUD.

Static Crypt

Spoiler ([Click to View](#))

Dear god, crypting. Nightmare of many, including myself.

Sadly there's no easy way to go about it, keep trying and you'll get it FUD sometime!

- First of all you will need to figure out if you're using your crypters startup or not.
- It's usually always recommended to do this, but remains your own choice. (in most cases)
- Let's say you're crypting a .NET based RAT. (Ex. Luminosity, Orcus, Nanocore) you are confined to using the 'inject into self' option if you plan on using your RAT's startup. (Your file is likely to corrupt if you don't do this)
- If you plan on using your crypters startup or are crypting a native RAT you can use other injection methods although I myself don't personally recommend it.
- Now that you've read all of that let's get onto crypting.

RAT startup.

- Start by opening static crypt.
- Open the 'main' tab and choose the file you wish to encrypt.
- Click on the 'crypt' tab you'll see that your injection method will be chosen for you.
- Head over to the 'extra' tab
- At the right you will see '.exe' click that and clone the assembly from an existing legitimate program. (Honestly this is the part which makes crypting hard)
- Once you've done that go back to the 'crypt' tab and press crypt.
- You've now got a file without an icon which is likely to cause a lot of detections.

- You will want to make an icon following this tutorial.

<https://hackforums.net/showthread.php?tid=5182868>

- Once you've got the icon open up the icon changer.
- Click on .Exe and choose the file you just crypted.
- It will give you multiple of those icons below that.

- Choose the with the HIGHEST width and click on that.
- Now click on 'replace icon' and choose the icon you made with the tutorial earlier.
- Although it looks like the icon didn't change, it DID. Don't worry.
- You can verify by dragging your .exe into a different folder and the icon will change.
- Your file is ready to be scanned on scan.majyx.net

- Is your file not FUD? Try different assemblies, the problem does NOT lie with your icon.
- Tried bunch of different assemblies but can't find one that works?
- Instead of changing assemblies keep the same assembly and bump your file by 20 - 60kb. (done in the options tab)
- Crypt, not FUD? Bump by 60 - 100kb, crypt. Not FUD? Bump by 100 - 160kb and repeat until it's FUD.

Crypter startup.

- Open the 'main' tab and choose the file you wish to encrypt.
- You will also want to enable 'startup' and the folder it gets dropped in. (Usually I go for %appdata%)
- You will also want to enable persistence here under 'settings.'

- Click on the 'crypt' tab you'll see that your injection method will be chosen for you.
- Head over to the 'extra' tab
- At the right you will see '.exe' click that and clone the assembly from an existing legitimate program. (Honestly this is the part which makes crypting hard)
- Once you've done that go back to the 'crypt' tab and press crypt.

- You've now got a file without an icon which is likely to cause a lot of detections.
- You will want to make an icon following this tutorial.

<https://hackforums.net/showthread.php?tid=5182868>

- Once you've got the icon open up the icon changer.
- Click on .Exe and choose the file you just crypted.
- It will give you multiple of those icons below that.

- Choose the with the HIGHEST width and click on that.
- Now click on 'replace icon' and choose the icon you made with the tutorial earlier.
- Although it looks like the icon didn't change, it DID. Don't worry.
- You can verify by dragging your .exe into a different folder and the icon will change.
- Your file is ready to be scanned on scan.majyx.net

- Is your file not FUD? Try different assemblies, the problem does NOT lie with your icon.
- Tried bunch of different assemblies but can't find one that works?
- Instead of changing assemblies keep the same assembly and bump your file by 20 - 60kb. (done in the options tab)
- Crypt, not FUD? Bump by 60 - 100kb, crypt. Not FUD? Bump by 100 - 160kb and repeat until it's

FUD.

Data Protector V4

Spoiler ([Click to View](#))

Will be updated to text when I get a higher post limit!

Common questions (F.A.Q)

Spoiler ([Click to View](#))

Q: What's the best RAT?

A: There is no best RAT. Every RAT has it's own strong and weak points.

Q: What's the best crypter?

A: Currently I believe Cyberseal is the best crypter around. (on 04/07/2016)

Q: Do you need a VPN?

A: No, you do not. Just like you don't need a seatbelt when driving but we all know what happens if something goes wrong and you aren't wearing one.

Q: Do you need a DNS?

A: No you don't but you'll permanently lose all your clients if your IP changes.

Q: Personal recommendations?

A: Luminositylink/Orcus with Cyberseal and crypticVPN.

Q: Where can I download Darkcomet?

A: NOWHERE! Darkcomet doesn't exit. Think of it that way.

Q: Should I buy a crypter?

A: Yes, don't even BOTHER with free crypters. Just no.

Common errors. (Taking suggestions)

Spoiler ([Click to View](#))

Don't do ANY of this.

Spoiler ([Click to View](#))

RAT Related

- Do not use Darkcomet for the reason that it has serious security flaws. (I will deny you help if you insist on using this RAT)
- Do not use Blackshades for the reason the police took over the product.
- Do not use NO-IP for the reason that it is monitored by Microsoft.
- Do not use duckDNS for the reason that they'll give you honeypots.
- Never use the same port for 2 RATs. (or program in general)
- Participate in banking fraud.

Crypter Related

- Use startup in both crypter and RAT.
- Use any settings in both crypter and RAT.
- Never crypt a crypted file.
- Inject into a process when using startup on a .NET RAT. (Ex. Luminosity)
- Do not cry to crypter owners about a 10/35 detection rate, it's your own fault.
- Assume scantime and runtime is the same.
- Do not use the website <http://www.virustotal.com>

HF products you NEED to stay away from

Spoiler ([Click to View](#))

- [Ghostcrypter](#) - NO NO AND NO!
- [Blazin hosting](#) - Look at his damn trust scan + the amount of terrible reviews on his threads. DO NOT BUY OR TRUST!
- <https://hackforums.net/forumdisplay.php?fid=136> - Everything in that damn section!
- [Botnet Bible v3](#) - Just another money scam.
- Open for more suggestions

Flowerson - July 4, 2016, 10:21 am

Great read - thanks for combining every other thread into one more or less.

Mr. Robot - July 4, 2016, 10:33 am

(Jul 4, 2016 10:28 AM)LulzClerk Wrote: [\[CITE\]](#) Can you just fuck off, this has already been explained thousands of times already, getting tired of your shit tbh. We don't need you to explain stuff we already know, or that has already been explained before ALOT. This is common sense

Things change over time, half the full on tutorials in the past still recommend using NO-IP which is funny as hell but at the same time can cause major issues.

OP took some time and you could look at this more as him sharing his learning curve in the hopes it helps other people.

This should still go in the tutorial section IMO as it will get better views and awareness.

bzr? - July 4, 2016, 10:37 am

Great thread Kief, lots and lots of quality content here.

Mitlar - July 4, 2016, 10:43 am

Good thread may I ask why you'er using the old version of static?

Purple Kief - July 4, 2016, 10:49 am

Oh my... Anger issues?

Nice thread Kief! ?

ForceJew - July 4, 2016, 12:18 pm

Great guide very useful for beginners.

I don't really need it but should be great for people who just started.

As always great job Kief

Koopa. - July 4, 2016, 12:46 pm

Really nice thread, this will be linked to every LQ thread I see here.

Twixles - July 4, 2016, 12:59 pm

Neat, hopefully this will reduce the amount of "my rat isn't working" threads.

Dastoks - July 4, 2016, 1:27 pm

Finally an updated and well mapped and planned guide ! THANK YOU OP

Once ill have the free time ill read this in full details and hopefully ill be able to rat again :)

Thanks for a sick guide brother !

ElHusy - July 4, 2016, 4:04 pm

Very nice and clean thread! This will come in handy for many users. And major vouch to Kief, he's helped me out over skype before!

Koopa. - July 4, 2016, 4:05 pm

Wow, a paid sticky?

You are really dedicated to this section, and that's great.

Mr. Corleone - July 4, 2016, 4:12 pm

Excellent and HQ tutorial. I literally don't understand how some people say that this has been posted so many times when this tutorial is up-to-date and really nice, and I seriously like the format. Really nice of you to make it sticky because I know people come here and always look at stickys first. This is excellent for noobs, and of course others who are willing to expand their knowledge.

Armada - July 4, 2016, 4:27 pm

Very well written and thorough. Not often you see people pay \$50 for a sticky for these threads either.

#Skyline - July 4, 2016, 6:30 pm

(Jul 4, 2016 04:27 PM)Armada Wrote: [\[CITE\]](#) Very well written and thorough. Not often you see people pay \$50 for a sticky for these threads either.

I use to do this with my free RAT support desk to help the RAT community.

Good job Purple with the thread. Will be very help to newcomers !

Armada - July 4, 2016, 7:28 pm

Sadly hard to maintain when you do the Help desk freely though.

Threads of importance like this Id honestly consider paying to have them stickied myself, but I dont think you can sticky another members thread. I could be wrong.

#Skyline - July 4, 2016, 7:41 pm

Crank456 - July 6, 2016, 8:55 am

Very nice Kief! I could have really used this a bit ago when I started getting back into ratting!

Google Ultron - July 6, 2016, 7:41 pm

I actually read it all and learned some stuff. Great guide! Didn't know duckdns honeypotted (might just be that I haven't been here for a while).

Good job! :)

Purple Kief - July 7, 2016, 2:06 pm

We've made it to 1k+ views meaning that at the very least 50 - 100 people now know more about RATs.

I'm pleased with this and still looking for more suggestion to add. :)

Thank you all.

VirtualMon3y - July 7, 2016, 2:52 pm

Nice guide Kief. Good effort bro.

DataByte - July 7, 2016, 5:00 pm

Nice guide man! I am glad to see this is stickied!

Diamondero - July 8, 2016, 5:58 am

Truly great work. A lot of thanks for that. When I was started to learn about RAT, I really needed something like that. Unfortunately I lost so much time for learn all of this by my own.

Thanks again :)

You asked for some suggestions, so here you've got:

What about section about: "My stub is ready. What's now ?" giving information:

- Where can we scan our stub and where we can't
- How to check if it's runtime FUD
- Where can we upload it and where we can't
- What to do to avoid unnecessary warnings when someone try to run our stub (I mean zipping it, using Autolt, I don't know, ready to learn some new methods ;-))

This should help for having stub FUD as long as possible

Second thing is spreading, but in my opinion spreading thread is as big as people's imagination, and there is no place for that in this tutorial. Maybe a few links for most common and update methods.

bzr? - July 8, 2016, 7:34 am

- Covered in my crypting tutorials.
- Only 1 website that does runtime scans, I forgot which one tho. (coming soon on viruscheckmate)
- Good idea, will look into it. I personally never upload files anywhere so I don't know many sites.
- Don't think I'm going to do anything with this.

Thanks for the suggestions, I appreciate them. Will look to have them implemented in there ASAP.
:) Taking more suggestions for anyone that has them.

YayHar - July 9, 2016, 6:23 am

Vouch for Kief. HQ from the start

Codefuser - July 9, 2016, 10:47 am

A sticky for this? Nice to see you contributing.

GG 111 posts

Welshdroo - July 9, 2016, 12:34 pm

HQ Post Kief ... Going help out community a lot and i have read every section and i have learnt

quite a bit from this thread ... Thanks OP

Phurkus - July 9, 2016, 4:17 pm

WOAHH @purpleKief

very impressive guide. bookmarked this for later use and reading (:

VOUCH for this guy, always very helpful, friendly, active and smart.

doomkit - July 10, 2016, 5:48 am

Good job kief keep best for it.

Markx96 - July 10, 2016, 3:19 pm

Hello, very nice tutorial! There's just one thing im having hard time with, is there any free VPN for port forwarding or I have to use premium ones? Thanks for help!

BEKFEST - July 11, 2016, 10:26 am

HQ thread thanks for this kief.

fSystem - July 11, 2016, 10:51 am

Honestly amazing tutorial! The added Skype help definitely surpassed expectations and Kief was able to answer any questions I had!

CGH Tompkins - July 11, 2016, 1:59 pm

Very nice guide, I really appreciate this things (: good luck.

Purple Kief - July 12, 2016, 12:25 pm

Thanks everyone for the kind words, I appreciate it and I hope this helped you.

I can't keep purchasing stickies so I plan on bumping this once every 2 days. (of there being no comments)

Anyone got a problem with that? :)

JASON AND MEDEA - July 13, 2016, 11:50 am

Purple Kief - July 16, 2016, 6:19 am

IF YOU DON'T AGREE WITH SOMETHING LET ME KNOW.

Added a new section to the guide, still open for suggestions.

It's currently in the middle of the guide due to the posting limit but I'll move it to the bottom when I get ub3r.

For those that don't want to go look at my guide.

What RAT should I buy/use?

I'm so tired of seeing these threads that I'm just going to implement a little review in this one. It'll be based on popularity and what I've personally read about that RAT.

PAID

Spoiler [\(Click to View\)](#)

LuminosityLink

Spoiler [\(Click to View\)](#)

Public opinion

- + User friendly
- + Easy to use
- + Stable
- + Excellent support
- Has a .NET dependency

Personal opinion

I personally think LuminosityLink is currently the top RAT out there. It's so easy to use, it's so stable I still hold some clients from a couple months back. KFC is always on top of his shit and has a shit ton of guides all over the place you can go to look for guidance.

My overall personal rating for this RAT is 9.5/10.

Orcus

Spoiler [\(Click to View\)](#)

Public opinion

- Not so user friendly
- + Easy to use, hard to setup
- +/- Stable for some, less stable for others
- + Excellent support
- Has a .NET dependency

Personal opinion

I personally think Orcus can go big but isn't there quite yet. It's hard to say what's holding Orcus back since being a support member I know everything is managed as it should be. Just like Luminosity I hold only praise for this RAT although I personally have trouble with holding my clients, which is not the case using Luminosity.

I think other than (imo) the stability and it being a little different from other RATs in setup Orcus is a great tool.

My overall personal rating for this RAT is 8.5/10 (I'd give a 9 but the stability really hurts me)

Ozone

Spoiler [\(Click to View\)](#)

Public opinion

- Hard to use
- HVNC is slow
- +/- Some say it's stable others hate it
- +/- Often see comments for support but answers are given in PM. (could mean 2 things)
- + Has no dependencies
- Most expensive RAT

Personal opinion

I personally think Ozone is touch and go. I had it for 1 day while writing this guide, it looked clean

and I couldn't find something that really bothered me. It has this weird preload feature which I don't really understand but aside from that it seems to function like every other RAT. I can't comment on support due to all support being done in PM.

It's biggest feature is HVNC which some users say is very slow.

My rating for this RAT is a 7/10 (I really haven't used it a lot, don't look at this rating and go nvm fuck this)

Nanocore

Spoiler ([Click to View](#))

Public opinion

- + User friendly
- + Easy to use
- + Stable (or atleast it used to be)
- + Not much questions being asked so can't comment on support
- Has a .NET dependency
- Not that many features
- + Cheap

Personal opinion

Nanocore, originally created by Aeonhack one of the 'legendary' names on HF. I wish I could say a lot of good about it but I can't. It's NOT a bad program in the slightest but fact is the other RATs here blow it away. They have more features and are still maintained by their original programmer. When I used Nanocore I enjoyed it a lot but that was back in Aeonhack's days. Nowaydays I'd recommend a different RAT.

My rating for this RAT is 6/10 (lack of features)

FREE

Spoiler ([Click to View](#))

njRAT

Spoiler ([Click to View](#))

Public opinion

- + Decently stable
- + Easy to use
- No support
- Password recovery is broken (there's a fix on HF tho)
- Has a .NET dependency

Personal opinion

njRAT is the first RAT I ever used and I don't really have many complaints about it. For a free RAT I'm honestly impressed with how stable it is. Using it back when I was a noob probably using all the wrongs settings I managed to hold clients for 1 - 2 weeks. The remote desktop is decently fast too, overall it's my favorite free RAT.

My overall rating for this RAT is 7/10

Darktrack

Spoiler ([Click to View](#))

Public opinion

- Not so stable
- + - Easy to use, little harder to setup (without a guide)
- + - Support (touch and go)
- + No dependencies
- Early stages = bugs

Personal opinion

First time I set up this RAT I immediatly encountered a bug. Being experienced I decided to ignore it and it did indeed turn out to just be a visual bug. Other non-experienced members might have spent 30 min - 1h trying to fix it even tho there was no real bug there. Aside from that I heard it's not stable yet, people are losing their clients when closing the program etc. It's got a couple of cool features like the skype monitor thingy but aside from that I'm not convinced yet. (don't release something that isn't ready)

My overall rating for this RAT is 4/10

Babylon

Spoiler ([Click to View](#))

Public opinion

- + - Sorta stable
- + Easy to use
- No support
- Webcam capture is not fully programmed although it works for most
- + Has no dependencies
- Mouse control does not work

Personal opinion

Babylon is probably the most recommended free RAT currently available. (together with Darktrack) My friend used to use it a lot and watching him use it it seems like an OK program. I did see him loose clients every now & then so that's worth noting. Aside from that the program works as advertised and is not bad at all.

My overall rating for this RAT is 6/10

Purple Kief - July 18, 2016, 6:57 am

Giving this a bump.

Still looking for feedback. :)

v47093 - July 18, 2016, 9:43 am

man, I really enjoyed this guide, perfect for every noobie here (like me ?)

**This is a late feedback, OP is fast tho at providing service, Thanks ?

Klima - July 18, 2016, 10:08 am

Thanks for giving time in this RAT section Kief ?

Bad Boy - July 19, 2016, 1:50 pm

Good tutorial for new users.

From a very Experienced user. Big-up Purple Kief ?

L33T Member - July 20, 2016, 9:18 am

Thanks for helping me setup fagdns it took a bit of cause I didn't know what I was doing lol thanks tho.

much love OP, great fucking work! <3

GG123 - July 27, 2016, 4:09 pm

Awesome guide! really appreciate it! got LL working :D

Purple Kief - July 31, 2016, 8:09 am

With the return of [ShockWave](#) (creator of IM4) I have now added [Imminent Monitor 4.3 \(C# port\)](#) to my guide!

He was kind enough to provide me a free lifetime license and I'm very thankful for that. We're glad to have you back. I encourage everyone that owns the program to help sniff out bugs and other potential issues.

Later today, or possibly tommorow I will also add [Data Protector V4](#) to my guide. I've had my eye on that crypter for a while but have always been turned off due to the price tag compared to other crypters. I've now spoken to [n0\\$f3ratu\\$](#) (jesus christ that name ?) and he seems like a really cool dude. He was even kind enough to provide me a 24h code to add it to this guide. He showed me runtime results of the crypter and they're pretty good. You guys can look forward to that.

Please do leave a comment if you enjoyed, I spend a lot of time working on this guide. :)
More updates will be added in the future without a doubt.

kingshakes - July 31, 2016, 9:06 am

Thanks for the good work man....it really solved my crypting issue

Poor you, another victim of the god damn ghostcrypter scam.

I suggest getting a different crypter.

If you insist using GC then disable everything in LL and enable it in the crypter.

If that doesn't work you can basically go fuck yourself. (seriously get a diff crypter) ?

Dr. King Schultz - August 8, 2016, 9:10 am

Have you considered adding a tutorial on how to purchase and setup a namecheap domain as a DNS service? I feel like most people don't do this because they see it as a 'manual labour' type of thing, but in reality is no different to FreeNOM or other services.

Purple Kief - September 1, 2016, 2:16 am

(Aug 30, 2016 11:01 AM)BzRk Wrote: [\[CITE\]](#) Have you considered adding a tutorial on how to purchase and setup a namecheap domain as a DNS service? Purplr Kief can you prescribe good server that's compatible with use on VPN on it?I don't fuck with VPS's since I'm more whitehat than most guys.

Can't help you with this one.

As I said in my previous comment, here's the new 'testing your stub properly' section.

You can find this in the middle of the guide below setting up your RAT. :)

How to test your stub properly

Spoiler [\(Click to View\)](#)

What do you mean? Test it properly?

Well, using the wrong IP inside of your builder usually leads to no connection. As most of you might think there's multiple IP's to use in multiple situations. You can find them down below.

BUILD YOUR STUB ACCORDING THE 'SETTING UP YOUR RAT' SECTION!

Alot of you are testing your stubs the wrong way, making you think things are broken while that

might actually not be the case. Here's how you test your stub properly. (All of this assumes you are running your RAT on your actual pc and not somewhere else)

Where am I testing my stub?

- 1) On the same computer you're running your RAT on.
- 2) On a VM on the same computer that you're running your RAT.
- 3) A different computer in the same network.
- 4) An outside computer outside of your network.

What IP do I need for that?

- 1) SAME COMPUTER = localhost or 127.0.0.1
- 2) VM SAME COMPUTER = Your IPv4 or when using a VPN your public IP (found at canyouseeme.org)
- 3) Different computer same network = Your IPv4 or when using a VPN your public IP (found at canyouseeme.org)
- 4) Computer outside of your network = Your public IP found at canyouseeme.org or your DNS.

Couple of examples.

- 1) Testing on my own computer --> <https://gyazo.com/26352d88a01457884aa949c5a32949e6>
- 2) Testing on my own VM (no VPN) --> <https://gyazo.com/6b9590b953c96285083efb9894c1aea2>
- 3) Testing outside of network --> <https://gyazo.com/2f3586ac057ed84882e55c3e2681d07c>

HELP NO CONNECTION!!

Calm down, don't panic. This guide WILL have the fix you're looking for but start by checking the following:

- Is my stub crypted? Always test connections uncrypted! This way you'll know if it was your crypter that broke the stub or not.
- Did my AV remove it? It might not look like it, but this is the case 95% of the time. Go check if the process is actually running.
- Am I being a dumbo? Did you misread a portion of my guide? It's very possible, go read over it again.

armageddonx - September 7, 2016, 12:55 am

i am just testing connecting on the Rat i have not built the stub. what i don't understand is that after opening port on VPN i got a successful port opened notification but if i test port on Rat its failed.

Purple Kief - September 8, 2016, 6:33 am

(Sep 7, 2016 12:55 AM)armageddonx Wrote: [\[CITE\]](#) i am just testing connecting on the Rat i have not built the stub. what i don't understand is that after opening port on VPN i got a successful port opened notification but if i test port on Rat its failed.

It's cause you're not reading every line like I literally tell you too, and I honestly don't feel bad for you. :)

Any of you guys need a namecheap guide? I mean.. It can be done. ?

JOhnnny - September 8, 2016, 10:27 am

Check it out boys, update coming tommorow!

Will have links to all RATs and (maybe) something extra. :)

Johan Cruyff - September 28, 2016, 5:08 pm

Thanks for getting me a DNS host!

Vouch for this guy!

Purple Kief - September 30, 2016, 6:00 am

As requested about 2 - 3 weeks back I've added links to the free RATs.

Quasar got updated just a few days ago, go check it out!

There's no link for Darktrack since I don't know what luckyducky actually wants for his RAT.

I've also started my own middleman service to avoid people getting scammed!

If you've dealt with me before or trust that I am not a scammer, every comment is appreciated. :)

Jamdoog - October 2, 2016, 7:31 am

Sweet guide man! I'm sure it will help some people ?

Purple Kief - October 4, 2016, 6:53 am

I've added # v1.6.2 professional to my guide. (Shoutout to Eminem for the copy to use in my guide)
How does this RAT compare to the others? In my opinion it's overpriced. It sure is a powerful tool, I see A LOT of customization options so if that's your thing then this definitely isn't bad for you. Sadly other than the customization I don't see anything to warrant the high price tag. (Maybe the UAC exploit but is that really worth that much money?)

Would I pay the 650~\$ for a 1 year license of this tool? No. But that might just be me, if you've got the money and customization is your thing then definitely atleast try it 1 month!

NOTE: I still have to add it to my 'what RAT should I buy' section but that'll be for later when more reviews have come out.

v1.6.2 Professional

Spoiler ([Click to View](#))

- Connect to your VPN if you are using one. If not skip this step.
- Completely disable your firewall! (VERY IMPORTANT)
- Open #.
- Click on 'Local settings'
- Fill in your open port, password (which you will need inside the builder) and click add.

- Click 'save settings'.

- Once you've done that go to canyouseeme.org fill in the port and if it says success your port is opened correctly!

v1.6.2 Professional
Spoiler [\(Click to View\)](#)

startup.

Connection tab: Fill in your DNS/IP, port and hit add.
Installation tab:

Stealth tab: Enable stealth, NO INJECTION, enable the anti's you want. (VMware, Virtualbox)
Keylogger tab: Enable whatever keylogger you want. (I personally recommend log everything)
Surveillance tab: Enable whatever you want. (I recommend leaving empty)
Build tab: Choose 'Do Not Compress' and click build.

Crypter startup.

Connection tab: Fill in your DNS/IP, port and hit add.
Installation tab:

Stealth tab: Enable stealth, NO INJECTION. Enable anti's in crypter.
Keylogger tab: Enable whatever keylogger you want. (I personally recommend log everything)
Surveillance tab: Enable whatever you want. (I recommend leaving empty)
Build tab: Choose 'Do Not Compress' and click build.

EXTRA SCREENSHOTS:

LogicGeek - October 4, 2016, 7:02 am

I've read your thread fully, before this I thought you was just a kid who was always demanding something from others,
but I've appreciated you work now, good luck with that mate, nice info for newbies here.
This type of activity & threads can help a lot of people on HackForums.
Good luck,
Best Regards, LogicGeek!??

Or better to change it to what you recommend? Sorry for my bad English I remember you, you're the russian dude I helped like half a year. I appreciated the donations dude. (Think you were the first person ever to donate to me) It's not bad but crypticvpn is better.

purest21 - December 22, 2016, 2:38 pm

Thanks mahn this was helpful. My FUD rat is very ready now but the tutorial that's remaining is spreading. Can you please shed more light on what happens after a successful rat creation (spreading) ?

ken0man - December 23, 2016, 4:53 am

what is the difference between native and managed stub/rat?

Purple Kief - December 23, 2016, 11:31 am

(Dec 22, 2016 03:38 PM)purest21 Wrote: [\[CITE\]](#) Thanks mahn this was helpful. My FUD rat is very ready now but the tutorial that's remaining is spreading. Can you please shed more light on what happens after a successful rat creation (spreading) ? Spreading? What's there to know?

(Dec 23, 2016 05:53 AM)ken0man Wrote: [\[CITE\]](#) what is the difference between native and managed stub/rat? Native = Does not require .NET framework to execute
Managed = Opposite

Fairly widely covered all over HF.

ken0man - December 23, 2016, 6:51 pm

i have a keylogger coded in AutoIT & Python and i crypted it with data protector, when i tried executing it on a win7 pc it popped up error message and stub didn't execute, i googled the error message and discovered the error got something to do with to .net not updated on the target pc. but the stub in the crypter shows as "native" yet requiring .net.

Purple Kief - December 24, 2016, 10:32 am

(Dec 23, 2016 07:51 PM)ken0man Wrote: [\[CITE\]](#) i have a keylogger coded in AutoIT & Python and i crypted it with data protector, when i tried executing it on a win7 pc it popped up error message and stub didn't execute, i googled the error message and discovered the error got something to do with to .net not updated on the target pc. but the stub in the crypter shows as "native" yet requiring .net. Data protector = .NET framework 2.0 (I think not sure)

You're adding the dependency by crypting a native stub with a dependency crypter.

ken0man - December 24, 2016, 3:07 pm

you are right about that, i just thought of it after reading your post. thanks.

XXXfranky - December 26, 2016, 6:31 am

Is there any Multi-platform rat right now?

What are you actually trying to accomplish ?

purest21 - January 11, 2017, 12:04 pm

Hey Kief, while using crypticvpn is it possible or necessary to forward port on both UDP and TCP?

I don't know why my upload and execute won't work with most rats I've tested.

I mean it works on my own vm that has same network connection but when i test on another network, it wouldn't upload nor execute.

-ViTALiTY - January 11, 2017, 3:08 pm

EDIT: Solved, thanks a lot Kief!

Purple Kief - January 15, 2017, 3:10 pm

(Jan 11, 2017 01:04 PM)purest21 Wrote: [\[CITE\]](#) Hey Kief, while using crypticvpn is it possible or necessary to forward port on both UDP and TCP?

I don't know why my upload and execute won't work with most rats I've tested.

I mean it works on my own vm that has same network connection but when i test on another network, it wouldn't upload nor execute. Your upload & execute won't be affected by UDP/TCP. Just choose both it makes no difference.

(Jan 11, 2017 04:08 PM)DiTEC Wrote: [\[CITE\]](#) EDIT: Solved, thanks a lot Kief!

(Jan 27, 2017 09:28 AM)GammaDune Wrote: [\[CITE\]](#) I consult this guide Everytime I want to set up a new RAT. I've used it to set up IM4, Nanocore, Luminosity Link, and Quasar RAT. It works every time and is my go-to guide. Thanks Kief, excited for the new guide too ;)Very welcome dude, glad to

see some people manage to figure things out on their own using my guide. :)

(Jan 29, 2017 06:45 PM)rwj2010 Wrote: [\[CITE\]](#) Awesome Guide....Very helpful but can you update with the new updates. Specifically IM4.5

Thanks.I don't see any reason to update the IM part for now. I will update it with the new UI update.

(Jan 30, 2017 08:03 AM)germi89 Wrote: [\[CITE\]](#) would like to see your review of imminent monitor. As for myself.., i just whan ta good stable rat that i can crypt and send thru email. sugestions?

Is it really hard to get a rat FUD? some people i know are saying i need to pay someone to do it.
whats the password for njRAT?
It's not hard, just takes patience and some knowledge. Read the guide you'll be fine.
Also, you're gonna make me cry man.

(Feb 1, 2017 05:34 PM)PurePhoenix Wrote: [\[CITE\]](#) This is incredibly comprehensive and answers a ton of questions. Thanks very muchYou're more than welcome. :)

(Feb 2, 2017 02:09 AM)germi89 Wrote: [\[CITE\]](#) babylon rat doesnt work. Fix your links!Works for me, might want to try again.

Found another idea that might be helpful. Gonna experiment a bit and see what I can do.

BlackPanth3R - February 2, 2017, 8:21 am

In your opinion, is an exploit more effective than a crypter?

Purple Kief - February 5, 2017, 2:12 pm

(Feb 2, 2017 09:21 AM)kennytripler Wrote: [\[CITE\]](#) In your opinion, is an exploit more effective than a crypter?

Good question that cannot be answered so simply.

Without any additional information you can assume that an exploit will be more effective 80% of the time.

Clova - February 5, 2017, 2:22 pm

Thanks man, really helps out :)

JELLY?IsH - February 6, 2017, 11:38 am

Great post Purple Kief, I just have one question. So, I'm using virtualbox and njRAT. Should I use NAT or Bridged network for virtual machine (windows 7 in this case). Because, I can't make my port open. I'm using 143vpn.

bzr? - February 6, 2017, 12:38 pm

(Feb 6, 2017 12:38 PM)whiteSEC Wrote: [\[CITE\]](#) Great post Purple Kief, I just have one question. So, I'm using virtualbox and njRAT. Should I use NAT or Bridged network for virtual machine (windows 7 in this case). Because, I can't make my port open. I'm using 143vpn.

I always preferred to use bridge, but it doesn't always work

JELLY?IsH - February 6, 2017, 2:09 pm

(Feb 6, 2017 01:38 PM)??zrK Wrote: [\[CITE\]](#) I always preferred to use bridge, but it doesn't always work

But I think that it has to stay Bridged, because as NAT I don't have any connection.

kisori - February 7, 2017, 2:43 pm

Very good tuto?

Just a question and you can configure Luminositylink with vpn .mullvad?

Purple Kief - February 8, 2017, 6:48 am

(Feb 6, 2017 03:09 PM)whiteSEC Wrote: [\[CITE\]](#) But I think that it has to stay Bridged, because as NAT I don't have any connection. Fairly certain that's correct.

(Feb 7, 2017 03:43 PM)kisori Wrote: [\[CITE\]](#) Very good tuto?

Just a question and you can configure Luminositylink with vpn .mullvad? You can configure any RAT with a VPN.

kisori - February 8, 2017, 9:15 am

(Feb 8, 2017 07:48 AM)Purple Kief Wrote: [\[CITE\]](#) Fairly certain that's correct.

You can configure any RAT with a VPN. Même si le vpn ne prend pas Port Forwarding?

Joy™ - February 8, 2017, 6:39 pm

xViP3R - April 23, 2017, 7:36 am

Hello Purple! I have a few questions. Firstly, i need to port forward via VPN since i have no router. Does it have to be a VPN that supports a dynamic or static port? And which of the paid VPN's do you recommend? I have heard good things about Cryptic VPN, but I wanted to ask you first. Also

which of the paid RATS do you recommend currently?
Cheers and nice guide! :)

Purple Kief - May 18, 2017, 5:19 am

Giving this guide a bump since I feel it will still help a decent amount of users.
If you have any questions/recommendations about the guide do let me know.

R.I.P - May 19, 2017, 2:00 am

Perhaps a possible limitation on LuminosityLink (-) should be its forced consent message to clients outside of your given country. What's the status on ImminentMonitor's review?

Very helpful tutorial.

Purple Kief - May 19, 2017, 2:57 am

(May 19, 2017 02:00 AM)R.I.P Wrote: [\[CITE\]](#) Perhaps a possible limitation on LuminosityLink (-) should be its forced consent message to clients outside of your given country. What's the status on ImminentMonitor's review?

Very helpful tutorial.

I don't know what you mean by limitation.

I'm fairly certain everyone already knows my opinion on IM.

Spoiler [\(Click to View\)](#)
it's my favorite ?

I'll be updating my guide later today/tommorow, the new RAT (<https://hackforums.net/showthread.php?tid=5621975>) will be included and NanoCore will be removed.

bzr? - May 19, 2017, 3:37 am

(May 19, 2017 02:57 AM)Purple Kief Wrote: [\[CITE\]](#) I'll be updating my guide later today/tommorow, the new RAT (<https://hackforums.net/showthread.php?tid=5621975>) will be included and NanoCore will be removed.

Awesome Kief, been wanting to see what the new kid on the block is like ?

R.I.P - May 19, 2017, 3:44 am

@Kief: By limitation I mean it is inconvenient for many users. Also, fagdns.su is out of service so I'd recommend updating that when you get the chance.

Purple Kief - May 19, 2017, 4:24 am

(May 19, 2017 03:37 AM)bzr? Wrote: [\[CITE\]](#) Awesome Kief, been wanting to see what the new kid on the block is like ?

It's a parent for all the HF kids that don't know what an IPv4 is.

(May 19, 2017 03:44 AM)R.I.P Wrote: [\[CITE\]](#) @Kief: By limitation I mean it is inconvenient for many users. Also, fagdns.su is out of service so I'd recommend updating that when you get the chance.
Thank you.

Shoutout to Revcode for providing this tutorial account to me.

I have added:

RevCode Webmonitor

Spoiler ([Click to View](#))

You don't have to port forward. Yeah you can enjoy that.

RevCode Webmonitor

Spoiler ([Click to View](#))

Log in on their website <https://yourusernamehere.revcode.eu/index.php> and click on 'Client'.

Install = Will make sure the client comes back upon restarting their computer. Enable if you want.

Persistence = Will prevent closure of the client process. Enable if you want.

Click on 'Generate & Download' and EXTRACT your client file (.exe) to your desktop.

Your file is now ready to be sent to your clients.

I have reworked:

What RAT should I buy/use?

I'm so tired of seeing these threads that I'm just going to implement a little review in this one. It'll be based on popularity and what I've personally read about that RAT.

PAID

LuminosityLink

Spoiler ([Click to View](#))

Public opinion

- + User friendly
- + Easy to use
- + Stable
- + Excellent support
- Has a .NET dependency
- Has a region lock

Personal opinion

I feel like KFC has a nice program but it's simply out-matched by other RATs sold on the market currently. It does not help that he implemented a region block making blackhat use (looking at you reading this) pretty much impossible.

Which used to be my favorite RAT now scores at about 6.5/10.

Orcus

Spoiler ([Click to View](#))

Public opinion

- + Not so user friendly
- + Easy to use, hard to setup

- + Stable for some, less stable for others
- + Excellent support
- Has a .NET dependency

Personal opinion

I think Orcus is going in a straight line forward. Armada is doing his best managing the product and to my knowing Sorzus (the developer) is still working hard to improve it. If you like the feel that Orcus has then you're not making a mistake buying Orcus. Keep in mind more so than other RATs Orcus depends on .NET 3.5 which is not the same as 2.0.

I'll give Orcus a 8.5 for the really high customizability and Armada being a sausage.

Imminent Monitor 4.3

Spoiler ([Click to View](#))

Public opinion

- + Very stable
- + Insanely good UI
- + Good customer support
- + User friendly
- Has a .NET dependency

Personal opinion

I think Imminent Monitor is currently the top RAT sold on HF. Shockwave is a highly experienced developer and has been working on Imminent Monitor for 5 years+.

Other than Shockwave sometimes getting a bit lazy (don't we all) I really can't say anything bad about this RAT.

Going to give Imminent Monitor a well deserved 9.5/10. Not a 10 remember when it comes to coding, nothing is perfect.

RevCode Webmonitor

Spoiler ([Click to View](#))

Public opinion

- + No portforwarding
- No customizability for your client file (DNS/Hidden is missing)
- + More information pending

Personal opinion

There's 2 things I can see straight from the bat.

- User friendliness is ridiculous. There is no setup, literally nothing.
- This software is straight whitehat. There will ALWAYS be a double installation dialouge.

Overall I think this software is great if you're dealing with a less technical person. This would be a perfect recommendation for a dad/mom for example.

I would like to make clear though that the remote desktop stream seemed quite slow, even on a local connection. If you're all about that sweet FPS this web RAT is not for you.

I have removed:

- FagDNS is now no longer operational. (Shoutout to Panthere)
- Everything Nanocore related. (R.I.P Nexus)
- Everything Ozone related.

As usual I am open to any feedback/suggestions.

bzr? - May 19, 2017, 4:31 am

(May 19, 2017 04:24 AM)Purple Kief Wrote: [\[CITE\]](#) Imminent Monitor 4.3

[sp]

Public opinion

+ Very stable

+ Insanely good UI

+ Good customer support

+ User friendly

- Has a .NET dependency

As usual I am open to any feedback/suggestions.

Shouldn't IM be 'Imminent Monitor 5.0' ?

Here you go, my account will probably expire later today/early tommorow so if anyone has anymore requests do let me know.

Spoiler [\(Click to View\)](#)

The Black Angel - May 20, 2017, 3:01 am

Thank you for sharing appreciate. Will give it a try does it require crypter?

(May 20, 2017 02:25 AM)Purple Kief Wrote: [\[CITE\]](#) Here you go, my account will probably expire later today/early tommorow so if anyone has anymore requests do let me know.

Spoiler [\(Click to View\)](#)

Thank you for sharing appreciate. Will give it a try

(1) Does it require crypter?

(2) is it fud?

(3) What make the rat so fantastic than others?

Purple Kief - May 20, 2017, 3:51 pm

(May 20, 2017 03:01 AM)The Black Angel Wrote: [\[CITE\]](#) Thank you for sharing appreciate. Will give it a try does it require crypter?

Thank you for sharing appreciate. Will give it a try

(1) Does it require crypter?

(2) is it fud?

(3) What make the rat so fantastic than others?

1) Don't bother it has a forced double installation dialouge.

2) Maybe? Makes no difference.

3) It's not better than other RATs sold. It's still a web RAT which (should) slow down performance a bit.

As stated under 'what RAT should I buy' this RATs strong point is that there is no setup. (Literally none)

Purple Kief - June 4, 2017, 4:58 am

How can this be done?

sorry my naive question.. :(

Can you imagine a world where you'd need to create a new file for every new system?

Although not foolproof thinking, generally if a .exe works on a computer outside of your network it should work on all computers outside of your network.

You'll need to keep dependencies in mind but you'll get to that when you do.

Ghostzapper - June 24, 2017, 9:36 pm

Thanks Kief, your work has helped me out quite a bit...and I really appreciate it.

Cypherhaze - July 4, 2017, 12:05 am

Really nice guide!

But one question, I cant contact Armada because i havent rep, so wich other paid DNS did you know?

Armada - July 4, 2017, 1:21 am

(Jul 4, 2017 12:05 AM)Cypherhaze Wrote: [\[CITE\]](#) Really nice guide!

It's down, my apologies.

Mick Jenkins - August 17, 2017, 3:00 am

Best tut on ratting in HF deadass!
one question tho

since im using freenom for the dns
and i set everything the way you did other than the domain name of course would my dns address be

<https://babymon.tk.www> ?

or would it be something else?

Troep - August 18, 2017, 12:51 am

How much slaves do you have atm??????

Encyclic - August 18, 2017, 6:35 pm

Very nice tutorial from my boy over here! Definitely a must read for anyone looking at getting into this area!

Thank you mate!

cap-salazar - August 23, 2017, 2:30 pm

Hello BlazeHø?en,

I am using the imminent monitor and I have this problem

I installed an imminent monitor server on a remote pc and when it goes off it disconnects and does not reconnect

I have already installed it several times on the same remote pc and the same thing happens

And I checked that I did not have deep freeze or something like that

These are my suspicions

- 1) can be the DNS connection
- 2) IMMINENT MONITOR may be installed incorrectly on my PC
- 3) can be the configuration with which the server creates

First of all, Thanks

I would also like to know if I have properly installed my imminent monitor on the PC

labnolblog - August 23, 2017, 6:23 pm

Any Stable Android Rat (Other than androrat and spynote)

I would also like to know if I have properly installed my imminent monitor on the PC

- 1) Highly doubt it, connection comes through at first.
- 2) No.
- 3) Possibly. Did you enable installation?

My guess would be antivirus software on reboot.

Thanks for the guide!

What do you mean by most RATs? Free RATs are probably outdated, most paid RATs around here have a working password recovery tool. If it does not work consider one of the following:

- Is my binary crypted?
This will create instability.
- Does my client have passwords saved?
You cannot see that which is not there.
- Is it important to have these passwords?
* Just ask your client.

Pcms01 - October 19, 2017, 9:21 am

Don't buy Orcus, Armada will ban you. There exists nothing on HF that you use 'over' a crypted file(downloader, sorta). DP4 is a crypter that works on raw unedited binaries.

mgpppetel - October 30, 2017, 11:30 pm

which other way can i set port forwarding on my router, i copied the gateway ip address to my web browser (google chrome) in other to configure my port forwarding, but it always says that the "site can't be reached" 192.168.43.1 refused to connect. Please advise!

Purple Kief - October 31, 2017, 7:44 am

(Oct 30, 2017 11:30 PM)mgpppetel Wrote: [\[CITE\]](#) which other way can i set port forwarding on my router, i copied the gateway ip address to my web browser (google chrome) in other to configure my port forwarding, but it always says that the "site can't be reached" 192.168.43.1 refused to connect. Please advise!

If you can't get to your router page via your default gateway you should check your IPS's website. If you can log on there's a high chance the port forwarding will be embedded into their website. If not you'll need to contact your ISP as I don't know of any other way to reach your PF page.

Phackfo - October 31, 2017, 8:23 am

Thank you so much for this!

Rertr0 - October 31, 2017, 11:42 am

Very useful if you're finding problems and you don't know what to do read this then if this fails message him

Null911 - October 31, 2017, 12:04 pm

Posting to come back later! Thanks for the awesome guide!

themoomoo - December 8, 2017, 12:36 am

hey there op, I followed everything but my rat doesnt seemed to worked on the 2nd part,

Where am I testing my stub?

- 1) On the same computer you're running your RAT on. (worked)
- 2) On a VM on the same computer that you're running your RAT. (not working)

I am running it on sandbox but nothing pops up, port forwarding and dns have been set up properly. (canyouseeme.org is able to see me on the port, ping on cmd returns data, using freenom with .tk)

What could be some of the common issues/mistakes that I have overlooked? (using Njrat Lime edition 0.7.8 for this tutorial)

SpriteSurface - December 10, 2017, 5:57 pm

Thanks for the guide! Was very helpful in starting up a RAT successfully.

TheWolf™ - December 11, 2017, 11:37 am

@Purple Kief Thank You very much 9ice 1

chaozu - January 21, 2018, 10:03 pm

Great guide, I learned a lot! But I still have some questions. I use a Mac and have a VM with Windows on it. My goal is to set up a client which I can reach from my VM when the client is in the same network or not, both should be possible.

Question #1: Is it possible to connect to my clients computer through a DNS from my VM, when I am either in the same network, or in a different one?

I am currently trying to get it to work with njRAT, but only got it work on the same computer so far. I plan to use Imminent Monitor at the end, but before I buy it, I want to get it to work with njRAT.

I don't have a VPN, so I did the port forwarding and used the IPv4, which shows up in the ipconfig on my VM.

Question #2: Do I maybe need to use the IP from my Mac, since in the end, the connection goes to my Mac as well?

I didn't crypt the clients file, I just turned off the Anti Virus software for test purposes.

I noticed that the internal IP from my VM is changing quite frequently, that's why I want to use a DNS.

I did the port forwarding in my router, and it should be working, but when I test my ports, no matter if it's the one I forwarded, or the standard ones like 80, 53, 110, I either get a Time out or Connection refused on canyouseeme.

Question #3: That clearly shouldn't be normal, right?

I appreciate the time and effort you've put into this guide and would be very glad, if you, or another kind person, could help me out here.

Thank you for reading my post.

Thank you for reading my post.

Question #1: Is it possible to connect to my clients computer through a DNS from my VM, when I am either in the same network, or in a different one?

A: I don't really understand your question in general but you can connect to your clients from anywhere if you're using a DNS. Just change the DNS settings.

Question #2: Do I maybe need to use the IP from my Mac, since in the end, the connection goes to my Mac as well?

A: If you're not using a VPN that's the only IP you should be using. Only use 127.0.0.1 for local or IPv4 for same network.

Question #3: That clearly shouldn't be normal, right?

I'm 99% sure your problem is located somewhere in there. It's not mentioned anywhere in my guide but you need to set your VM to bridged (for your port) to host your RAT on there.

(Mar 29, 2018 02:01 PM)Skidderino Wrote: [\[CITE\]](#) whats a good DNS to use as im using noip atm would it still be fine?

If you're not using it maliciously.

I have removed LuminosityLink from my guide entirely. The product has been removed from the market a while ago I just haven't gotten to removing it from my guide.

I have also removed both Imminent Monitor's and Orcus crypting information. I consider both

Shockwave and Armada friends of mine and it was disrespectful to their products to put this in there in the first place. I will never bring this section back, do not ask for it. If any other RAT owners would like the crypting part to be removed please feel free to ask, I will get to it ASAP.

gr0w - March 31, 2018, 11:34 am

Thanks for your work with this guide. It is very well done!

I have a question about using a VPN ip address for the client to connect to. The last time I used a RAT I was using No-IP in case my ip address changed. I now have a dedicated VPN that allows port forwarding. If I setup the port forwarding on the VPN service, can I use my external IP address after connecting to the VPN in the RAT connect back settings? And do I not need to open the port on my router if I am using a VPN?

Also, what is the best option for staying anonymous, using VPN or VPS to host the admin program?

Thanks for your time

Purple Kief - April 10, 2018, 7:08 am

Thank you for the comment! Sorry I'm a bit late on the reply, busy year.

Yes you need to use your external IP address inside the RAT builder. No you do not need to open the port on your router if you are using the VPN.

Brady1225 - July 24, 2018, 9:30 pm

So I set up a VM, just to be safer while I RAT people. Before I open up the VM, I always connect to my VPN (Cryptic's), however, when I try to open the port on the VM, the port is showing as closed. Any clue as to why? Thanks in advance! ?

EDIT: Just for clarity sake, I've disabled my firewall (both on VM and actual PC), I am using Quasar

and while the port doesn't show up in the VM, it does work while I'm on my normal PC.

RAT-Atoo-ee - July 31, 2018, 12:13 pm

Still a great guide even today.

Just tested on local machine will be testing when I get home on separate networks and variations to ensure connectivity no matter where I'm able to control the routers port forwarding lol.

Been having so much trouble getting it to work. I hope it does! I honestly think its been the DDNS services i was using. Everything else checked out.

A bit embarrassed to say that it was No-IP, Now i'm currently running Freenom and its been very stable and reliable. I tried DNSDynamic and its constantly rubber banding from my IP to the default IP by the site. I decided to scrap DNSDynamic for Freenom. Though once I get some more money saved up i'll likely swap over to armada. \

Thanks so much for the guide! ?

D33PN3T - August 23, 2018, 12:40 pm

Hi

Thanks for the tutorials

The 888-tools[dot]com and rekings[dot]com available for sale on this site are safe and you and other friends have bought? (You suggest)

Is nvpn[dot]net secure or ...?

Introduce a stable rat that is multi os (Android, Linux, MacOS)

Which of these omnirat or jRAT, rats is stable and FUD ?

Armada - August 24, 2018, 7:26 pm

arkark - December 25, 2018, 1:45 pm

(May 19, 2017 04:24 AM)Purple Kief Wrote: [\[CITE\]](#) It's a parent for all the HF kids that don't know what an IPv4 is.

Thank you.

Shoutout to Revcode for providing this tutorial account to me.

I have added:

RevCode Webmonitor

Spoiler [\(Click to View\)](#)

You don't have to port forward. Yeah you can enjoy that.

RevCode Webmonitor

Spoiler [\(Click to View\)](#)

Log in on their website <https://yourusernamehere.revcode.eu/index.php> and click on 'Client'.

Install = Will make sure the client comes back upon restarting their computer. Enable if you want.

Persistence = Will prevent closure of the client process. Enable if you want.

Click on 'Generate & Download' and EXTRACT your client file (.exe) to your desktop.

Your file is now ready to be sent to your clients.

I have reworked:

What RAT should I buy/use?

I'm so tired of seeing these threads that I'm just going to implement a little review in this one. It'll be based on popularity and what I've personally read about that RAT.

PAID

LuminosityLink

Spoiler [\(Click to View\)](#)

Public opinion

+ User friendly

+ Easy to use

+ Stable

+ Excellent support

- Has a .NET dependency

- Has a region lock

Personal opinion

I feel like KFC has a nice program but it's simply out-matched by other RATs sold on the market currently. It does not help that he implemented a region block making blackhat use (looking at you reading this) pretty much impossible.

Which used to be my favorite RAT now scores at about 6.5/10.

Orcus

Spoiler ([Click to View](#))

Public opinion

- + Not so user friendly
- + Easy to use, hard to setup
- +/- Stable for some, less stable for others
- + Excellent support
- Has a .NET dependency

Personal opinion

I think Orcus is going in a straight line forward. Armada is doing his best managing the product and to my knowing Sorzus (the developer) is still working hard to improve it. If you like the feel that Orcus has then you're not making a mistake buying Orcus. Keep in mind more so than other RATs Orcus depends on .NET 3.5 which is not the same as 2.0.

I'll give Orcus a 8.5 for the really high customizability and Armada being a sausage.

Imminent Monitor 4.3

Spoiler ([Click to View](#))

Public opinion

- + Very stable
- + Insanely good UI
- + Good customer support
- + User friendly
- Has a .NET dependency

Personal opinion

I think Imminent Monitor is currently the top RAT sold on HF. Shockwave is a highly experienced developer and has been working on Imminent Monitor for 5 years+.

Other than Shockwave sometimes getting a bit lazy (don't we all) I really can't say anything bad about this RAT.

Going to give Imminent Monitor a well deserved 9.5/10. Not a 10 remember when it comes to coding, nothing is perfect.

RevCode Webmonitor

Spoiler ([Click to View](#))

Public opinion

- + No portforwarding
- No customizability for your client file (DNS/Hidden is missing)
- +/- More information pending

Personal opinion

There's 2 things I can see straight from the bat.

- User friendliness is ridiculous. There is no setup, literally nothing.
- This software is straight whitehat. There will ALWAYS be a double installation dialouge.

Overall I think this software is great if you're dealing with a less technical person. This would be a perfect recommendation for a dad/mom for example.

I would like to make clear though that the remote desktop stream seemed quite slow, even on a local connection. If you're all about that sweet FPS this web RAT is not for you.

I have removed:

- FagDNS is now no longer operational. (Shoutout to Panthere)
- Everything Nanocore related. (R.I.P Nexus)
- Everything Ozone related.

As usual I am open to any feedback/suggestions.

Would someone please explain to me what is meant by "a double installation dialouge"?

(Dec 25, 2018 02:45 PM)arkark Wrote: [\[CITE\]](#) Would someone please explain to me what is meant by "a double installation dialouge"?Disregard, got my answer

SIM-4030428 - January 5, 2019, 12:24 pm

Great thread, definitely deserves to be bumped to the first page.

One - January 11, 2019, 6:38 am

(Jul 5, 2016 07:43 AM)Purple Kief Wrote: [\[CITE\]](#) Thanks everyone for the kind words.

I noticed I have some updating to do which I will do soon.

I'm also gonna add a category at the bottom containing links to other threads that might be useful. Maybe include another category for help desks? Not sure about that.

Is darkcomet rat good if not what rat would you advise?

Exodus - January 11, 2019, 6:39 am

How about Orcus, SuBBus, or Galileo?

Exodus - January 17, 2019, 11:20 am

(Jan 17, 2019 04:24 AM)BigFatDogShit Wrote: [\[CITE\]](#) How about Orcus
Could use that too now that it's free.

I appreciate you assisting people. Keep it up.

-Lunar - January 24, 2019, 6:15 pm

best paid rat? What do you guys think in your opinion! having one with hRDP or hvnc is preferred.
Also for educational purposes of course, most have policies that prevent people from doing blackhat things, and would revoke license. Out of the good ones in the market, which are known to be less enforced on?

Friendz - January 30, 2019, 6:49 am

First of all thanks a dozen for our well put together guide. A lot of effort went into it and its worth more than gold. Even though there are hundreds of tutorials out there, yours is THE BEST!

I have 2 questions for you if you have the time to answer.

1. In post #4, you discuss the importance of DNS. If we do setup DNS with the VPN ip address (canyouseeme.org), what happens if the VPN provider shuts down that server? Do we lose all the clients?

2. Times have changed since when I use to rat. Not sure if my question is now possible, last I checked it wasn't but any ways. If you are running the RAT from a VPS (RDP), your server can be shut down anytime. In that case are there rats or any techniques to "backing up" the clients/infections? If not then are there any risk/consequences/side effects if you were to have 1 client infected with 2 different RATs (Using different ports of course)?

nomanisland - February 21, 2019, 2:04 am

Download Link provided for nJRat is down.Can you please update the link.Thank you

Question no.1 shows me that you have no idea what DNS actually does. DNS simply changes a URL to an IP address. The owner of said DNS can change the IP address that is linked to the DNS in his configuration panel.

When you go to <https://www.google.com> DNS is changing that URL to an IP address for you to go

to. DNS admins over at google can change the IP your browser goes to at any time.

The RAT logic behind using a DNS is so that you don't lose all your clients when your IP changes, you configure your "URL" in your RAT builder, clients get redirected to the IP address you have configured on your DNS. Your IP changes, you re-configure your DNS and all is well in the world.

Your second questions strongly implies malicious use which I don't support which is why I'll leave that up to you to figure out.

Thanks for the explanation! I had a basic understanding of DNS but I was just super confused. I was under the impression that the RAT builder would be setup with the VPN ip address but this post clears it up ?

I think if your vpn has a static ip address you dont need dns you connect through your VPN

Simpleman.simplelife - February 25, 2019, 6:54 pm

Code Malware Hunter scans the internet regularly over time to identify C2 servers for various malware like RATs. RATs are typically leveraged by hackers with malicious intent to record audio, video and keystrokes, as well as exfiltrate files and more. Malware Hunter can currently detect at least 10 kinds of RATs, including DarkComet, njRAT, Poison Ivy, Ghost RAT and Net Bus.this is from thejournal dot com /articles/2017/05/02/industry-tool-detects-thousands-of-c2-server-rats.aspx

Soo there's that regarding njRAT, not to mention the multiple remote code execution public exploits targeting darkcomet and likely the bulk of free rats out there. As usual any such software is not to be trusted, VMs, vpns on host, public internet connection when interacting, etc
... or don't

Tok Pengait - February 28, 2019, 1:03 am

thanks for this....bookmarked!!

kijalo - June 11, 2019, 9:01 pm

Thank You for posting this Guidebook. I just started getting into rats and hacking and recently found this forum. It seems to have a whole wealth of useful knowledge and this thread is the best one I've

come across so far.

yogibear - July 24, 2019, 10:18 pm

Nice collection of RAT manuals. Thanks a lot man! <3

XJAGYT - August 1, 2019, 6:25 am

All the free vpns are paid now that you showed us is their any other ones?

Cooooool - August 1, 2019, 4:53 pm

I got a question. Is it more safe to use VPS or just run RAT on my pc with VPN? Or same?

It is generally more safe to run it on a VPS, but you can run it with just a VPN on your PC.

While this is great and all, it is just a little bit outdated considering all of the mentioned paid RATs have been raided.

providerG9W - February 27, 2020, 6:14 pm

interesante ojala y a todos les sirva, bien bien

ind_soresh - February 27, 2020, 10:22 pm

Thank you for this, this is a great guide. But not interested in RAT at all right now unfortunately.
