Thread: [.exe which run itself on a USB key ?](#)

SIM-2326771 - July 6, 2016, 10:15 am

Is there a way to setup a rat so when you put the .exe on a key, and when you plug this key on a computer, the rat run himself without having to go on the computer to run it ?

joepvand - July 6, 2016, 10:17 am

No, this was fixed in windows 7. i think it can be done on a cd tho.

Krulvis - July 6, 2016, 10:57 am

This has been disabled on Windows for around 6-7 years so you would either have to run it yourself, or store on the drive something the user would want to run in-order for them to be RAT'd.

Z3r0C0d3 - July 6, 2016, 11:27 am

I believe it cant be started automaticly If he is your friend , you can bind to a some file(movie , setup file etc.) when you open the file , the rat will start too

joepvand - July 6, 2016, 11:29 am

Zork - July 6, 2016, 11:39 am

Well this is my first post here on this forum hooray. Anyway you should check out something called usb ducky. It is a special programmed usb with a modified firmware that you can program to execute silent scripts. It costs around 45\$ and it is easily programmable. What you can do is force the computer to download your rat from a remote server silently on the background. If you are creative sky is the limit. It is pretty awesome in my opinion.

Vuln - July 6, 2016, 11:41 am

Not possible anymore with regular usb drives. Modifying the autorun file of U3 drives was once popular too, but that's no longer a viable option either.

There are however working alternatives like

<https://hakshop.myshopify.com/products/usb-rubber-ducky-deluxe?variant=353378649>

not blaming you, i get sick of people flaming people for just asking something. let me explain:

You can bind a MP4 to a EXE because the EXE gets executed.
You cant bind a EXE to a MP4 because a mp4 never gets executed. A mp4 doesnt open, the player opens which reads from the mp4.

Reply with questions :)

One thing to note though, you're right, some more experienced hackers do "bind" their code to all kinds of files, jpgs, wmv's, etc. but they aren't running the code as an executable. The code opens in whatever program, say if it's a jpg file it'll open in Windows Photo Viewer. The code that is being read from Windows Photo Viewer is being executed which in turn exploits the application it's opening in. It can also force the file to open as an executable or script, which is a process called Steganography. Probably worth looking into once you get a better idea of things.

Probably worth looking into once you get a better idea of things. for now i dont mind spreading RATs etc . I am concentrated on Programming and Networking to understand how the things works , for know i know Basics of Python , PHP , Javascripting , SQL ,HTML (its not programming language , i know the basics , but i can read it vey good) and planning to start with C++(i know basic stuffs of it , loopings , conditions etc.) i dont want to follow tutorials blindly , i want to know how the stuffs working

I noticed almost all new commers asking dumb questions like "Can you give me a hack for this" i personally i doing things that i know how works ,i am not hacking because i am concetrated on Programming and Networking for now because you need to know whats happening in the background

Armada - July 6, 2016, 12:14 pm

www.usbrubberducky.com

Thats what you are looking for OP

Vuln - July 6, 2016, 12:52 pm

There will indeed always be exploits, but those similar to your example will be very rare, worth a lot of money, and usually get patched fast. So most likely not an option for you, OP.

Also, steganography is nothing more than the art of concealing a file or any kind of data in another file.
