Thread: [NetScript - Scripting Framework \[in Development\]](#)

BahNahNah - July 10, 2016, 5:46 am

Im having a good time learning about parsing. Though i might make a dev thread so people can give me some pointers along the way.

The reason this is not in the C# subforum is because when this is finished, it will be a library that can be used with C# and VB. (This thread will turn into the release thread when its done, no point making 2 threads)

And yeah, i know its messy.

What am i trying to make?

Im trying to make a framework so people can easily add scripting capabilities to already completed projects with little hassle.

So, what have i go so far?

I have a basic framework setup to add methods, variable types and keywords:

Spoiler [\(Click to View\)](#)

[\(Github link\)](#)

basic scripts are running good!

Spoiler [\(Click to View\)](#)

even without good formatting!

Spoiler [\(Click to View\)](#)

So what is to do?Add more types

Improve error handling

Structure more like a framework

Add some sort of heirachy systems fo functions can be called from a class/namespace

Add an "event" the osystem so functions in the script can be called from the .net program.

Please leave feedback!

I noticed you use

```
Code { get { return ...; } }
```

which can be simplified in c#6 to

```
Code => ...
```

Other than that, it looks great!

What happens when people try to compile that in lower versions o.o.

Then I'd tell you to upgrade to VS 2015 :p

Ive seen that. Im trying to do this without using regex.
Thanks though.

Look into something called BNF. It's the way a formal language is created.

<http://www.multiphaselabs.com/images/comp/a23/bnf1.png>

<http://www.multiphaselabs.com/images/comp/a23/bnf2.png>

It can be very helpful for the type of project you're working on. Good luck.
