Thread: [Darktrack setup problem](#)

emzee - July 12, 2016, 12:39 pm

Good day everyone,

I'm having a problem while setting up Darktrack, and I'd like someone to help me out. I've setup the DNS and used utorrent built-in feature to automatically port forward my port, However the there seems to be a problem in the connection settings whenever I try to create the server, when I right click my created DNS and choose "Test All IP's" I get "Failed!" in the status column, I'd like to know what does this imply. see the image below.

Thanks in advance!

UPDATE!

I got to the point where "Test ALL IP's" reported "Works!" finally, but it seems that the client doesn't show any connections.

I'm using a free VPN <https://www.vpnme.me/freevpn.html>

I used the FR Server and their 443 port as my server port as it's already port forwarded, and used fragdns.su for DNS, everything should be working fine, but when I run the server sandboxed nothing shows in my client side.

UPDATE!

I'm wondering whether the problem is with the DNS not having a port forwarding option or is it with my setup, I've setup two VM's, one infected by the server and one running the client, fagdns updater and openVPN client.

if you look at the following pictures it's clear that the ports can be utilised however still nothing appears on my client.

Darktrack Client:

Darktrack Server:

Don't run this from your PC, use a VPS.

I'm using A Virtual Machine for testing so far, but I thought about getting a VPS as I don't have access to my home router and can't seem to get port forwarding with VPN done correctly. do you know any free low specs VPS's?

when i use [censored] my internet is doing down why?

Dave from the lawyer firm - July 14, 2016, 8:53 am

just don't run this on your PC.

yosuasito - November 15, 2016, 10:36 am

have u fixed your problem? coz i have the same problem like u

purest21 - November 28, 2016, 8:06 am

my own shows "works" when i click "test all ips" yet i dont see any connections when i installed it on another pc

eSko8 - November 28, 2016, 9:34 am

Use torguard VPN if you need to port forward they will email you a config

Do we have any update on this matter ? I have managed to port forward succesfully and test the IPs. With the DNS address its failing but with my device's IP it says that it works. However no client is connected.

Thank you!

This thread is 4 years old, if you are still using this "darktrack" on the same version and everything then I imagine its outdated and you should probably find a different RAT.
