Thread: [Hour idler that works on a Linux VPS and works with 2FA + Sends out messages.](#)

Poka105 - July 25, 2016, 6:11 pm

Are there any scripts to idle hours on a VPS that work with an account that uses 2FA, but is also able to reply to messages saying I'm away or something?

SparkMasterTape - July 25, 2016, 7:27 pm

use <https://steamtimeidler.com/> pretty sure they have a thread here, not sure. works with both, messaged one of the staff on steam and got that reply instantly

I meant something I could run on my own VPS, but I bought a 1 month sub on stidler. Thanks for letting me know about it!

Yeah you can, I use my friends VPS to idle 24/7. I will ask about it further when he is online.

There should be resources on a node.js script for idling steam accounts,
You should be able to add the 2FA on that with some lines of code.

<http://www.unknowncheats.me/forum/counterstrike-global-offensive/112322-idling-hours-using-node-js.html> <- A script you can use.

<https://github.com/seishun/node-steam> <- Documentation which you will probably need.

If you don't know javascript try to get someone else to do it for you or just pay for a service.
