Thread: [\[Bot\] Catch any Pokemon of your choice using PokeVisionFinder](#)

05317832892 - August 1, 2016, 8:52 am

[img]http://www.pokemongo.com/static/assets/images/pokemon_go_logo.png[/img]

Hello fellow hackforum members, today I am going to explain how to set up and use pokevisionfinder. It will give you the cords to ANY pokemon you want, and it's only a few clicks away.

Requirements:

*Python 2 (Must not be python 3)

*The Pokevision Finder

[Download for the programs bundle](#) (This contains the outdated PokeVisionFinder, it still has the right autosniper though)

[Github Link](#)

Once you have python 2.x.x installed navigate to where you downloaded the file, drag and drop the folder from inside the zip and put it on your desktop. Inside it should look like this:

Spoiler [\(Click to View\)](#)

[img]http://image.prntscr.com/image/b97d9fa767c241ca8f7171fd19d8a2cf.png[/img]

Open the file pokevisionfinder.py with notepad++, navigate down to line 29. There are two lines we need to complete, one is ps_path and the other is ps_dir. Within the folder you downloaded open up the autosniper, click on pokesniper2 but don't open it. Then click on the top file path bar and copy the text, here is an example: (The red scribble is to block out shit such as family member names and my school name, plz no dox me.)

Spoiler [\(Click to View\)](#)

[img]http://image.prntscr.com/image/6addc22532114d14b1386c91f837ff82.png[/img]

That string of text, the file path goes in the first variable, and then the second variable is exactly the same but without the \pokesniper2 on the end. Example:

Spoiler [\(Click to View\)](#)

[img]http://image.prntscr.com/image/4d0a327455ef489bba06916dc83ad3cd.png[/img]

Now we move over to the sniper and configure that, open up user.xml with your favourite text editor. Fix the following lines:

Line 3: Choose Google or Ptc

Line 6,7,8,9: Fill in the appropriate, ignore the irrelevant

Line 4,5: Fill in the cords of your last login

Now you are done! Rightclick pokevisionfinder.py and click edit with IDLE and then once open press F5. You should see this:

Spoiler ([Click to View](#))

[img]http://image.prntscr.com/image/0ed6c27097c84f3e82c9201196216c29.png[/img]

Simply enter the pokemon you would like to catch and off it goes, make sure to capitalise the first letter. It will scan the cities provided in the cords file. Everytime it finds one it will launch the sniper and snipe the pokemon it finds, here is an example of me sniping pidgeys:

Spoiler ([Click to View](#))

[img]http://image.prntscr.com/image/0789be3cded847fe91a9f9c2296f588b.png[/img]

If you get any errors or have any questions, please post in the thread and refrain from PMing me if you can. This way others can help answer your questions and solve your problems. ?

Notes:

To stop the script, press ctrl-c or the close button on the window. Rare pokemon can take a while to find and feel free to add more locations in the cords file. Also in the first few lines of pokevisionfinder.py you can change the _zoomFactor, I recommend 1 but if you want you can change it to 2 or 3, this will just search a larger radius around each location.

Habbo Cracker - August 1, 2016, 10:19 am

Thanks for the tutorial but I have a problem if you can set it up to me via Teamviewer will be awesome man.

Thanks

05317832892 - August 1, 2016, 10:30 am

(Aug 1, 2016 10:19 AM)Habbo Cracker Wrote: [\[CITE\]](#) Thanks for the tutorial but I have a problem if you can set it up to me via Teamviewer will be awesome man.

Thanks

I don't use team viewer, please post here instead, explain what's going wrong/provide a screenshot of the error.

Habbo Cracker - August 1, 2016, 10:38 am

<http://hpics.li/bc70c8c>

Here is the link !

I think the problem its on ps_path and ps_dir

ChubbyKuma - August 1, 2016, 10:38 am

im getting HTTPError = 504

this is whats displayed in my pokevisionfinder:

Pokemon: Snorlax
[INFO] Looking pokemons in: New York, Central Park
[ERROR] HTTPError = 504

HobboCracker

under the line ps_dir remove the "\" after autosniper

Voltex - August 1, 2016, 11:15 am

Won't you get soft banned because you'll be sniping around the world?

A!DS - August 1, 2016, 11:56 am

Mine just seems not able to find any pokemon at all. Like I am just simply typing in Zubat and it can't find a zubat

05317832892 - August 1, 2016, 11:57 am

(Aug 1, 2016 11:15 AM)Voltex Wrote: [\[CITE\]](#) Won't you get soft banned because you'll be sniping around the world?

Nope, people have been sniping for ages, it abuses a glitch to prevent soft bans. Basically it teleports and then clicks on the Pokemon but while its battling the Pokemon it teleports back to the starting point and finishes catching the Pokemon. This way you don't get soft banned.

(Aug 1, 2016 11:56 AM)Chaney Wrote: [\[CITE\]](#) Mine just seems not able to find any pokemon at all. Like I am just simply typing in Zubat and it can't find a zubat
What is the console feed?

A!DS - August 1, 2016, 12:02 pm

Should work now, at the time of your post poodlecorp has the servers down. I suspect that is what caused your error.

Any help please ?

It literally can't find one, if it can find a pidgey then it's working. Test that please. If I can find a pidgey I would recommend widening the zoom in the first few lines of the pokevisionfinder.py file. Set it to 2 or 3.

Woes - August 1, 2016, 12:46 pm

Since pokevision is down, does that mean this tool wont work?

Destrox - August 1, 2016, 12:47 pm

here you go <https://www.python.org/downloads/release/python-2712/>

i downloaded Windows x86 MSI installer for my 64bit and it worked < if you had a hard time choosing the right one

05317832892 - August 1, 2016, 1:41 pm

I'll look into this, I'm at a friends house and I'm sleeping there tonight, won't be able to fix it. Also those asking about Pokevision going down. I had this working, I sniped about 20 charmanders this morning and Pokevision went down a few days ago. Everyone is getting the same error that that's a good sign. I'll update op to include the the github link incase there is a fix on there. Thanks for your patience guys.

shebang - August 1, 2016, 1:50 pm

This is because (a) Pokemongo.id has been blocked from using Skiplagged, and (b) Skiplagged's API isn't working because of high usage issues. Nothing wrong with the script (as far as I know).

05317832892 - August 1, 2016, 1:55 pm

Yes I have just looked through the code, it is using skip lagged's api. Here are to api requests one to pokemongo.id which seems to be an Indonesian Pokemon go forum? And one to the skiplagged Pokemon Api. We will just have to wait for skipped lag to come back up. Here you can see it is returning an error on their site and doesn't display Pokemon: <http://www.skiplagged.com/pokemon>

voidex - August 1, 2016, 2:20 pm

I tried that like 2 Days Ago, Not worked really great.

(Aug 2, 2016 11:22 AM)Katana Wrote: [\[CITE\]](#) By "sniping" pokemon. What do you mean? Like catching them?

First it checks coordinates to see if the Pokemon you want is there. Once it has, if your pokemon is there it runs PokeSniper which will catch it, then resume by checking the rest of the locations.
