Thread: [Install a lot of RATs can leave the victim's machine slow?](#)

aerohack - August 1, 2016, 9:26 pm

Let's say that I install 10 different RATs on victim's machine, a computer with "common specs" CPU: Dual core with MEM: 2 or 4 GB RAM and each process server consumes between 100 kb ~ 10mb, it would affect computer's performance to the point the person question that something is wrong?

K3njii - August 1, 2016, 10:16 pm

Why would you need to infect a client with 10 different Rats?

I used to do that back when I used dark comet, since I constantly lost slaves I would always have a back up one.

I used to have 3 backups, 10 is excessive.

Invest in a stable botnet and upload them there as a primary backup.

Each RAT has different features, and I like to make various combinations of RATs + Crypters, and if I lost the slave in one RAT, I can hold on in others.

Which Botnet do you use or recommend?
