Thread: [Avast detecting crypted server as MSIL](#)

shutdownnow - August 6, 2016, 12:55 pm

I managed to make my crypter 5/35, how can I remove this "MSIL" detection of avast? What trigger it?

Scan results: nodistribute.com/result/7V5MxlgLb8SfHCnGjhN1OcYo

MSIL seems to be the runPe, try to change variable names of your RunPe or change the storage methode (I just read it somewhere that sometimes its the "storage method of the runPe") that get detected, but I have no idea how it work..

for .net file there is mainly 3 storage method from 1 is detected and for other you need to work out to get it FUD.

EOF storage (Detected)

Native Resource

Managed Resource (the one you use)

ScammerHD - August 7, 2016, 3:45 pm

Try to change the PE Headers, if you haven't done already. It's very strange for a Program to have a .exe in its resources, so it's often detected.

just comment out segmentations of your code one by one and scan again, you'll see what it detects.
