Thread: [>>FREE GUIDE<< How To Run Unlimited NecroBot's Via Proxy >>FREE GUIDE<<](#)

Mephaela - August 11, 2016, 2:13 pm

Hey Guys! There has been a lot of people asking if it's possible to run multiple instances of Necro bot, yes, it's possible, however you must proxy each individual account, which is a bit of a pain to first start, but VERY worth it in the end. NecroBot's Proxy system DOES NOT work, so do not use it, to succesfully proxy your accounts, you will be using a program called Proxifier.

Here's what you do!

First off, if you don't already have Necrobot, here's the download link: [NecroBot Release](#)

Next, if you don't have Proxifier already (Which I highly recommend having anyway) Download it here: [Proxifier](#)

Next, you will need Proxies! I personall use Blazing Proxies, they have been fantastic so far, and they have a PokemonGo section for dedicated proxies specifically for PokemonGo. If you have any proxy problems, such as an IP getting blacklisted, they will exchange your proxy for a new and working one within minutes, they are also super cheap, highly recommend them here's their direct link: [Blazing Proxies](#)

Now that you have everything you need to start Proxying your accounts, you need to make sure your set up is correct, first off you will have to go into your Necrobot Config, find Auth.Json, and open it with notepad:

Edit the type of login, the username, and the password, as well as the proxy settings, when you're done they should look like this:

Now that you have your Auth.Json settings figured out, you will want to copy your original NecroBot folder as many times as you have accounts to proxy, for this example I have 7 accounts proxied, so my set up looks likethis:

Once your folders are set up, you will have to re name each individual NecroBot.exe so they are Unique, example, NecroBot1.exe, NecroBot2.exe, Necrobot3.exe, etc etc etc. THIS IS VITAL OR YOUR PROXIES WILL NOT WORK.

Ok, each bot is now ready to be proxied... Open up Proxifier, and in the top left, go to Profile > Proxy Servers, click on "Add". You will get a screen that looks like this:

Fill in the appropriate settings, make sure the final result looks like this (Obviously with your own

information filled in):

And then Press ok, this will add your specific Proxy to the list.

The next step is to change your proxification rules, you're almost done! Go to profile again, and this time go to Proxification rules. Just like before, click on "Add" and you will get a window that looks like this:

To find the path, press browse, and find your first NecroBot.exe that you want to add to the proxy and add it to the Applications list, and finally at the bottom of the window, select the dropdown box that says "Action" And choose the the proxy you would like to connect with on the account, the final result should look like this (Obviously with your own settings):

Now that you have your NecroBot added to the list, simply start it like you would any other time, and it will automatically connect you through the Proxy and run it like normal, repeat these steps as many times as you'd like to add a new bot on a proxy. Here is the result:

I hope this guide helped you out! If you have any questions or trouble, or just want to learn more, hit me up! Will gladly chat if I have the time, also please check out my E-Book I have for helping out with setting up bots to be more efficient, + help with configs etc.

Good luck Botting!!

Really? Mine stopped working a few days ago, it was just logging in via my own IP even when I had a proxy entered so I had to find another method, whatever works though!

damndoe - August 11, 2016, 2:48 pm

does that work with socks?

BTCEXchangez - August 11, 2016, 2:49 pm

Saving this thread for later, nicely written.

I don't believe so, but I haven't looked into it yet! If I do I will update this thread :)

I'm glad you're all finding this helpful!

Tor - August 11, 2016, 3:08 pm

Great tutorial, keep it up!

SpecterCraze - August 11, 2016, 3:12 pm

will try this and let you know. now i just need a good set of public proxy for testing purpose

SIM-403479 - August 11, 2016, 3:17 pm

Nice share OP. Hopefully get less of them threads now

DoxM3 - August 11, 2016, 3:28 pm

Awesome thread :) keep up the good work bro

CapsBruh - August 11, 2016, 3:44 pm

I will now try to setup 4 Necro's with my dedicated proxies from blazinseolllc.

I'll report back how it goes. I have had troubles trying to run haxton and necro at the same time in any situation.

Have heard differen't results from people, some say it works, some say it doesn't... Proxifier is 100% as of right now

It's probabably down to user error if it doesn't work and I think I know why.
A lot of the configs don't come with the quotations in place (" ") instead it just says null,

Need to make sure both the IP & port are in quotations or it won't work

Anyway, whatever is easier for the user. This looks simple enough to use, will make things quicker as well

100% correct, user error is likely because people have been consistently running 50+ proxies

without flaws.

I will more than likely make another guide as well to help people avoid human error ^^ Either way, this method is perfect for anyone that struggles

CapsBruh - August 11, 2016, 5:18 pm

Working of course for me now.

Amazing. Can someone sell me a level 30 quick as well?

Does anyone know where to buy single dedi proxies? it's weird, I know 1 Blazin proxy got blacklisted so far, I found 3 working. I have one mystery proxy at this point. Might wanna grab singles for customers.

Glad it's working for you! Will keep this thread updated as much as I can as things change.

Boosiebc - August 12, 2016, 2:08 am

downloaded the files gonna buy some proxys and give it a whirl thanks for the share

which plan did you buy from blazing?

Toncekkk - August 12, 2016, 3:42 am

Nice tutorial I am gonna save it for later:)

Aerozzz1 - August 12, 2016, 4:14 am

i can't find auth.json , any idea guys ?

Mephaela - August 12, 2016, 5:40 pm

Bumping this since I updated it, hope you all can proxy now!

Skumzy - August 12, 2016, 8:28 pm

(Aug 12, 2016 04:14 AM)Aerozzz1 Wrote: [\[CITE\]](#) i can't find auth.json , any idea guys ?

I believe you have to run Necrobot.exe when you first download it, and go through the full setup for it to generate the auth.json file.

KazerTheAmazer - August 12, 2016, 8:29 pm

Also the new necrobot is not working for some reason? Something to do with killswitch.

Clockism - August 12, 2016, 8:51 pm

Posting for later nice thread thanks a lot.

Mephaela - August 12, 2016, 10:29 pm

Using this exact process also works for PokeMobBot if anyone is wondering! I'm running 17 accounts at the moment very smoothly, working on getting more up

Kraintus - August 18, 2016, 8:12 am

Hi everyone ,

First at all, thank you so much for your guide. After following it, I have got 10 accounts at the same time without any problem. However I have a lots of status code 403 error connections and I guess that is relationated that randomly 1-3 accounts finally are down by the system. I guess that the reason is because I am connecting from JP to US (the private ones here are too expensive to afford it) and I have a ping of 100ms.

So I would appreciate if you know any way to decrease these 403 errors at least.

Thanks in advance
