Thread: [Vb.net use no-ip and DDNS for local service access](#)

ironlord - August 15, 2016, 1:12 pm

Hi everyone.

I'm trying to write a http server and it work on my local network,now I'm trying to make it accessible from the internet by using no-ip service as my DDNS for pointing to my ip address and using PPTP vpn service to allow portforwding.

Can someone help with this issue?

Zilog80 - August 15, 2016, 1:38 pm

Why is this related with .NET forum?

Is a no-ip or portforwarding 'question'.

Try here:

[Networking and Firewalls](#)

it consider as .Net question because the http server is written in vb.net and I want to find a method to use no-ip and vpn to access it from the internet

Zilog80 - August 15, 2016, 2:00 pm

For using no-ip you should configure properly your account in no-ip site.

For portforwarding you router to access to your http server outside from your network you should configure your router.

The http server should be coded in .NET, Go, Delphi, C, perl or whatever, is irrelevant.

Edited: Maybe this video helps. Its for Apache Web Server, but the idea is the same for your http server:

I know this method the point of using vpn is to perform port forwarding because when I'm using canyouseeme.com website to check if the port 80 is available or not it say the port is open by this result i should be able to access my server easily right or there is something I miss?
