Thread: [How to Bruteforce user/pass of Target PC? - Using IP to connect to target PC](#)

potat - August 17, 2016, 3:55 pm

Title Basically explains it...

I am a beginner at hacking, but I know a fair amount of basic stuff.

I am trying to hack into a PC on a different network than mine, knowing only the target IP address.

I am sure I am going to have to bruteforce my way through the Username\Password of the target PC. But I am not sure how too.

I was wondering if anyone here in the HF community could maybe supply me with a source of tutorials on how to do this, or personally show me how.

Thanks.

If you're using just an RDP you can crack it with Hydra. Tons of tutorials on the net, just google it. Or if the target as a VNC server running you can do that too.

Thanks for your feedback. What is this Hydra tool? Could you PM me a link to download it please? Thanks.

Hydra is a brute force tool. Maybe next time try googling, it tends to have amazing results.
