Thread: [\[Num.1\] Rat Spreading Method - Easy & Simple - Free](#)

Errorx32 - August 21, 2016, 9:44 am

Hey guys,

So I've been learning more about rats and I found a really great way to spread your rats in minutes! It's super simple to do!

Pros:

- Easy To setup
- Can get around 10-20 people every day. (Depends on the amount of time you put into getting them, you could get 100 a day!)

Cons:

- Might get banned (Would suggest making another account)
- It does take some time to get loads of people infected
- Most people will come back and say it's a virus.

Method:

Okay, so this method is pretty simple, you are going to want to make a new Freelancer.com account, the reason for this is because you are going to be a fake company that makes games, here is how it should go down in steps:

1. Make your account on Freelancer.com
2. Post a GIG, make yourself look like you work for a big Game company and you need your game to be tested.
3. Give the ratted files to them, then when they go to launch it, they will become infected.
4. Do this multiple times and you could get around 100 infected people a day, which is more than enough for taking down medium sized websites.

Enjoy the method, please don't share this any further than this forum!

Help with what? This is pretty self-explanatory.

Just create an Upwork/Freelancer account. Post a fake job like "Looking for Beta Testers Blah Blah Blah" after a few minutes you would get maybe 10-20 people sending their proposals. Just make a generic reply with your server's link. You don't even need to reply, you just wait for them to pop up on your RAT.

This is probably one of the best way to get bots, but it requires a lot of work and waiting.

phant0m.falc0n - August 22, 2016, 7:04 am

I wouldn't do this even though it's a great idea both sites can ban your account if you don't pay for the work they did unless you do want to pay them O_O

arnon - August 22, 2016, 7:51 am

Hmm its looks a great idea, never thought of that! Great post!

WhosYourDaddyNow - August 23, 2016, 10:29 pm

A some what tip of mine. Try and make it seem legit most people won't believe if you say the game is the new battle field or COD. But aye it might work if the person is a big enough idiot.

TheTwitchTerror - August 23, 2016, 10:36 pm

Really good method never thought of this lol good job

This method is posted somewhere else on this forums, and some of the people you try to infect know more about computers than you do and will know that you are trying to rat so they will open the rat in a VM and try to traceback you....

Some, not all! ?

On a more serious note, you raise a good point- do you or OP know of any (relatively simple) means by which one who would employ this method would be able to avoid being traced? (Besides the standard VPN, coffee shop, obscure Linux distro, etc. that can be time consuming and/or expensive...)

Savier - August 24, 2016, 1:57 am

Expensive? \$10 a month for a vpn? LMAOO

? No need to flamebait homie, there are most definitely expenses associated with projects such as these that aren't limited to just a VPN, not to mention VPNs are hardly the ends all of privacy and covering your tracks. And that's without getting into the terms of service for all the VPN services out there that will be more than happy to take your money in exchange for a promise "privacy and security" only to throw all of those promises out the window the Feds come knocking...

Savier - August 24, 2016, 2:22 am

Well "Homie" then you should probably do your research.

Go get a Vpn you trust, Servers Located in places like Norway where internet laws are different. Go make your own free DNS. Using a Domain and free hosting. Or just go buy Armadas Service. And your set. If they trace back they'll get the domain name. or the DNS. They trace it, will lead back to your VPN. Simple as that, now go crazy. ?

VISAO - August 24, 2016, 10:22 am

Nice method good job :happy:

Yeah, and then if your chosen VPN service provider does any sort of business in the United States, the FBI can subpoena the everloving fuck out of them, especially if you piss the wrong people off. VPNs in of themselves are not secure. Come on man, don't be so condescending, this is all stuff you should know if you claim to have done your research as thoroughly as you seem to think you have.

EDITs for syntax and clarification
