Thread: [Whats is the difference at the RATs? ALL](#)

Hi8snow - August 22, 2016, 5:02 pm

Hi guys,

read in the forum a lot people create threads about "best RAT?"

Mention LuminosityLink, Nanocore, Orcus, RCS Galileo, Inminent Monitor, DarkComet, Ozone, etc, etc, but.....

Whats is the difference at the RATs?

Which is better? Why?

About how is the code?

I dont know, im sure a lot experts/specialists in the forum help a lot people.

Comments are welcome ?

Go read the 'which RAT should I buy' section.

It'll hold a decent bit of the information you're looking for.

LordCoder - August 22, 2016, 5:05 pm

Same as asking yourself which forum is the best. You'll need to test all of them yourself, all developers always try to create the best product, even better when it's a profitable one. People will just say that X is better, other will just shit on that one for stupid reasons (instability, caused by the user most of the times or simply not enough features *sigh*).

This alone is the the correct question.
Hands down.

So about the code.
Now we have to question what your trying to control.
Windows, Mac, or *Nix.

This answer alone will determine your final solution towards the code.
If you want to control your android phone, your not going to deploy a windows binary to it, it needs to be a java api or other such methodology.

Although I can deploy a w32 binary to a linux based machine its a pain, so Id likely look towards a more direct approach such as a C shell script.

Apples/Mac/iOS IMO is a pain in the ass and I simply dislike apple altogether, but there is their own root methods as well.

End of the day, you need to determine your scope and build a baseline plan from there.

I know, im use LL, but make this post for the people, not for me, same thanks :)

Mr.Dark - August 25, 2016, 9:11 pm

It all depends on what you are looking for.

bzr? - August 26, 2016, 3:29 am

RCS is simply in another league to anything else.
