BSOD does not equal bios update. The bios update was most likely irrelevant, scan your HDD to make sure it's still good try a restore point in windows

if you HDD is good but you are still unable to recover windows do a clean install. I can guarantee the laptop is fine, issue lies with windows or HDD.

It's on an SSD. I've tried booting Windows 10 from a: 2 HDD's , USB and so far it's A BSOD. They all boot on other laptops.

then it's a ram problem, run the built in diagnostic. Can usually be accessed from boot menu.
