Thread: [Is my GPU dying/dead?](#)

Superiorx3 - August 28, 2016, 1:47 pm

Hey,

How can I tell if my GPU is the cause of my PC constantly crashing? When I had it in, my PC wouldn't get passed the windows logo without crashing. When I was finally able to boot my PC, it crashed within 20 minutes.

My screen will do this and then it freezes. If this doesn't happen, then it does the boot loop.

Spoiler ([Click to View](#))

That looks like a dead GPU.

UPDATE:

The card has started to do this. Looks like I'm in the market for a new GPU. Any suggestions?
Budget would be roughly \$400 cad
