Check the video brother ?

And as we know that most of the server run on linux/windows platform

so initially we can use Linux/windows commands to check/exploit the website

So, as we know in Linux ls is used for showing Lists files with permissions

so we will use

PHP Code

```
<?php  
;ls
```

etc. may be you will understand better using video ?

Thanks ? if don't then don't hesitate to pm me ?

Gonna try to deliver some constructive criticism on the tutorial.

I told us to check if the OS was vulnerable by typing in those commands. What would the expected outputs be if it is vulnerable?

Protip: Pics are great.

Otherwise nice tut!

Otherwise nice tut!

Suppose you tried pwd command so expected output will be the dir. location where are you in on your web page.

Thanks ?
