Thread: [Embed twitter feed in program?](#)

Lor?d - September 6, 2016, 6:28 pm

So I have tried simply putting a webbrowser on the form and setting the html as the html code for the twitter widget but it refuses to load. Just says "Tweets by @xxxxxxx"

I think it's having a javascript error or something.

Anyone have any ideas how I could easily embed a timeline in my project?

There's probably some really easy way i'm overlooking but I haven't slept in like 2 days and i'm just completely lost right now.

Is the one you tried where it says "Tweets by @whatever" only and doesn't load anything or were you trying to make it from scratch or something?

Well I tried to copy and paste my current code but HF's firewall blocked it or something.

I used twitter's Widget creator and copied the HTML code it generated.

My end result is this:
