Thread: [python sqlite3 inserting null values when not allowed](#)

**datguy.dev** - September 16, 2016, 11:23 am

Greetings,

I've been playing around with sqlite in python. I have this issue where I need the primary key to increment (sql side only). It keeps inserting null values there even if I specify to not allow null. :D

Anyone have success with this? I've googled and found a few suggestions; no luck. It always has the same results. I also get the same results if I slam the insert function in my script or if I take it nice and slow. I must be doing something wrong.

connection method:

```
connect = sqlite3.connect(sqlFile, isolation_level=None)
```

Mind explaining what you mean by defu x deuf? Never heard that before. Are you saying its shit?

Though it would be great, I dropped the autoincrement. My functions aren't calling those queries anymore so I'm just marking this solved.
