Thread: [Functional RAT?](#)

alexanderesyr - September 28, 2016, 1:40 pm

So, what I learned browsing HF is that what you need to make - and use - a good RAT is:

- 1) RAT software;
- 2) Binder. Some other software to hide a RAT (inside an image, video, file) or to change its extension;
- 3) Crypting. Since almost everyone uses antivirus, RAT softwares are easy to discover and stop. So it's hard to find a RAT still unknown to the vast majority of the antiviruses. Crypting, as far as I know, is for avoiding antiviruses.

For these reasons I wanted to know.

- 1) Which RAT software would you suggest me to use to hack a social media account? There is any recent RAT that I could use?
- 2) Which binder should I use. There are softwares that create RAT and bind them to something as well?
- 3) I really need an help for the Crypting part.

Any good tutorial from HF is welcome. This forum is so big it's actually hard to find what you need.

Thanks for reading! ?

You don't need a binder in all honesty, you could just disguise the .exe file to look like a software update or something.

I don't use RAT Software anymore, so I really can't help you at that. I used Imminent Monitor but I can't get it running anymore.

Binders - Surely you can find some on the forums.

There's really no specialities in Crypters, you put in the file, push a button and that's it. Unless you want to go in depth and make your own.

The search function is your friend.

A binder will only force it to open another file with it, doesn't actually change the extension, same with spoofers. Changing the extension to .scr or .pif is all you need if you really wanna spoof it but you will most definitely need a crypter if you want to infect anyone.

It's pretty handy..
