Thread: [Question regarding making an image fit screen size.](#)

Lone - September 29, 2016, 6:56 pm

Ok so I designed a page in AI and am trying to move it into dreamweaver but am running into a few issues.

Here is the web design: Spoiler ([Click to View](#))

The problem I am having is making the images fit the webpage so it stays even.. for instance if I were to take the css and put it in the image would not fit a 1920 x 1080 resolution and I would like it to stretch to fit the screen size.

I'm not even sure what I should be looking for, all I know is that I want the images to be centered and stretch to fit different screen sizes. If someone knows a good guide or video I would love to learn.

To see what I have so far you can visit the page if you want <http://heinous.xyz/home.html>

Try using background: url(images/background.jpg) center/cover no-repeat; if you aren't familiar with stylesheets, add this to your head section:

```
Code <style>
body
{
    background: url () center/cover no-repeat;
}</style>
```

Rushax - September 30, 2016, 4:18 pm

Put this in your stylesheet at the very top to get rid of any padding or margin for browsers.

```
Code *{
padding: 0;
margin: 0;
}
```

Inside the header div you've got the principle set up right. You just need to add another div inside of the container div.

From

```
Code <div class="bannerBg">
<div class="logo">Heinous.xyz</div>
</div>to..
```

```
Code <div class="bannerBg">
<div class="logo">Heinous.xyz</div>
<div class="nav-wrap">
<ul class="nav-menu">
<li>Home</li>
<li>Webm</li>
<li>Music</li>
</ul>
</div>
```

</div>

Then we'd need to apply certain attributes to tidy up our work (the nav will show as a list with bullets, pulling the nav bar to the right)

```
Code .nav-wrap{
float:right;
}
.nav-menu{
list-style-type: none;
}
.logo{
float: left;
}
```

Usul mentioned how to tackle the bg images so goodluck.
