Thread: [Earbuds which pick music for you depending on your mood/location\(any user data\)ideas?](#)

eats_sushi - October 10, 2016, 1:13 am

Dopics are smart ear-buds installed with each user's DNA identification profile. Through the use of predictive technology, bio-metric data and connection to the IoT, they deliver a new definition the concept of life music. Music tailored to suit each user's own music preference, mood, location, weather status and any other data collected. The ear-buds are connected to the Dopic app within supported devices allowing the user to set his/her own music taste to narrow the scope of the new music they wish to discover and experience. Dopic ear-buds are the future of music, music will choose us, this means; easy choices, great music and a new way to experience music for all users.

The purpose of the Dopics are to tackle the problem of oversaturation of the music industry making it difficult for music artists to penetrate in the market (due to all the 'noise'). They are aimed at the end-user, but they focus on the music artists as well. The Dopic ear-buds tackle the problem by acting as a filter for the distribution and the process of delivering the music to the user. Only the music the user wants to hear and that which impacts the user's emotions will be chosen to be played and this will determine the quality of the music, thus music which does not make it will be sent back to the artist with feedback.

The Dopics give new or aspiring music artists a chance for their music to be heard and if their music is not being listened to, it will be sent back to the artist and they will receive feedback.

Thoughts on this concept?

Darkwin - October 10, 2016, 1:15 am

I don't know i have mixed feelings about this, I know the technology is out there to make this possible - I just don't think we're ready to embrace it yet.
Its too futuristic for my liking, Kinda like Google Glass.

Impossible to pick music based on someone's mood in this day and age. Sorry

Lol you don't have to be sorry I know it's not possible in this 'day and age', but this is a speculation for the year 2076, I realise I didn't mention that. I still wish to hear your thoughts. Don't restrict yourselves with what can or cannot be done rather speculate on the concept itself instead of shooting down the idea due to the fact it can't be done with our current technology.

It can supposedly read your brain waves and read what parts of the brain are being stimulated?
Sounds far-fetched

Sift - October 10, 2016, 1:45 am

Sounds too good to be real.

Far fetched? You do realize they have a head-mouse for quadriplegics that reads neuro-waves and points the cursor wherever they want - it isn't far fetched at all; We have lots of technological advances which aren't being used commercially.

I absolutely agree with this the technology advancements in this generation are out of this world. They actually have a example of this technology from what I read about in Bill Gates house where you where a wrist band or head band and it transmits off of pulse (something like that) then picks songs around that general mood.

The technology is crazy to me; however, it's all possible.

DEADZ - October 10, 2016, 2:50 pm

If they can do it with cat ears anythings possible:

Nachfolger - October 10, 2016, 2:55 pm

But.. why?

Make a mobile app and target a larger spectrum of people. The world isn't ready to embrace something like this.

minimalist - October 10, 2016, 2:58 pm

Tasker + Google Play Music my dude...
