Thread: [DDOS server set-up questions](#)

iDemiurge - October 12, 2016, 11:34 am

So I would like to set up a server to do DNS amplification attacks and stop using my current bot net(possibly sell it).this is to be a test trial so I'm ok using a public script for now.

1)what do I need? Vps or dedi

1.1) can I get a free one a just use it till it gets banned?

1.1.2)if so where? Needs 1gbs up min

2)anyone know some good public scripts? (Would be willing to buy a solid private script for later set ups)

2.1) was told told to try this script but would like to know if it's good or if I should toss.

I cannot use links yet so:

(Pastebin) .com /MVSHApMz

3) was told to try an SSDP amp x50 with chargen amp list's since no one uses them anymore. So, how would I go about scanning and filtering for these lists?

3.1)does that script even help accomplish thouse requirements? (If not please help point me in the correct direction)

Thanks for reading and hopefully responding! :)

I would say it all depends on what you are trying to take offline. If you are going to just take home connections, offline I would just use a web based stresser. You could use a free VPS will get banned though for sure. You could always get a shell and put it on a server lol. That's how I use to do it for free VPS.

Kool. More looking to set up a server to test out the method and if i like it was gunna make a custom script and then design a stressor website lol :)

Also, knocking off a home connection is the main design but if it could knock off smaller websites that would be chill too. Want the list to be 100gbs+ though
