Thread: [hide vbnet program in c++ or delphi](#)

**invocker49** - October 13, 2016, 12:11 am

how can I hide my program vbnet or take a cover with c++ or delphi program

when I scan my program vbnet with exeinfope or RDG Packer Detector

it show that c++ or delphi I hope you understand the question

thank's

NetGuard wannabe?

K

Step 1: host .net clr.

Step 2: get default app-domain.

Step 3: load .net assembly in default app-domain.

Step 4: invoke the method that calls the form.

Done.

Now invoking Assembly.Load(...) you will end up only loading an assembly from the physical disk, if you want you can do a type of native runpe then use the overload of Assembly.Load(...) that takes a ByteArray instead to load it from memory, so you don't need to load the assembly from disk! Simply write the bytearray to a section in the Native PE and crypt it, then decrypt it in memory...

...much profit, very wow, gg?
