Thread: [Tutorial: How to distribute Python files as .exe files](#)

Ensky - October 14, 2016, 4:08 am

This is my first tutorial on Hack Forums, I hope that you enjoy it!

This is tried and tested on a Windows 10 machine with Python 3.5 installed.

Step 1:

Open up the command prompt and install pyinstaller via pip

pip install pyinstaller.

Step 2:

Once PyInstaller has successfully installed, you may CD into the directory of the file, I suggest placing it into its own folder as PyInstaller generates some extra documents.

```
cd <directory>
pyinstall <scriptname>.py
```

You're done!

"failed to create process" error

Head to your Python install folder, /scripts/ and then locate "pyinstaller-script.py"

Open it up in your text editor and add quotes around the directory, like so:

From

```
#!c:\program files (x86)\python35-32\python.exe
```

To

```
#!"c:\program files (x86)\python35-32\python.exe"
```

Save and exit, now your compile should work!

I'd remove the bottom part of your post because that will backfire on you.

Aha, thanks.

I still don't know the 'unofficial guidelines' of the forum yet.
