Resolve you DNS By Changing The DNS Address

In case the DNS failure is not resolved by the above solution, you might need to dig a little deeper and find out a solution to change the DNS address.

So i am sharing some steps with you to resolve this kind of problem in future so these are the steps to change the default DNS address of your browser to Google DNS address:

1. Open Control Panel
2. Look for the Network Connections in the panel.
3. Browse the network connection that your device is using.
4. In case if it is using broadband change it to "local area network"
5. If you are using "Wi-Fi" then select Wi-Fi connection and right click it to select properties.
6. Within the properties dialogue box select the internet protocol version 4 (TCP/IPv4) .
7. Select "Use the following DNS server addresses" and add below given addresses on it[Google DNS Address]:

Preferred DNS server : 8.8.8.8

Alternate DNS server : 8.8.4.4.
8. Validate this setting and click ok.

After you have completed the above steps, reopen your browser and try connecting to the internet again! and it should work else you can try some DNS Changer softwares.

Hope it will help you.
Thanks ?

This is true but generally doesn't help the average hacker with network problems. If one were trying to get around openDNS then this would work great but most blocking issues are not done through dns
