Thread: [URL Exists Checker](#)

TheDarkShadow - October 18, 2016, 9:17 am

Hi,
i am looking for a tool that verify if a web page exists or not, i explain better what i need:

- 1) I have a base URL for example: mysite.com
- 2) I have a txt file that cointains a wordlist, for example:
 - aaa
 - bbb
 - ccc

I need a tool that check every subdomain in the list, so:

- mysite.com/aaa
- mysite.com/bbb
- mysite.com/ccc

and tell me if exists or not.

I tried to develop an application that do that by myself, but it's too much slow, i need a faster tool that process a lot of tries at a second.

I'm not interested about the content or the page body, i just need a response code 200 or 404 or something similar.

Anyone know a tool that can do a similar work? And maybe some tutorial?

Thank you very much in advance.

Google up wfuzz. A very good tool for this I used some time ago.

Cheers,
Abducted ?

You could use a admin page finder for this, would probably the easiest since there's plenty of them, and you could use your own textlist.

I could also recommend wget -r -nd --delete-after, it might be what you're looking for.
