Thread: [ImageHide\(Hide text in a image\)](#)

ForceJew - October 18, 2016, 11:40 am

So i just made this thing.

Its pretty cool.

What it does:

1. gets text
2. base64 encodes it
3. aes256 encrypts it
4. save as a bitmap(using the class by 0xDEADDEAD)

And reverse

Github: <https://github.com/MrMutt14/ImageHide>

Thanks for taking a look

Credits to 0xDEADDEAD for the amazing bitmap to bytes and reverse!

Sakuto - October 18, 2016, 11:43 am

You just forgot to add your files to your commit.

Oh wait...?

Oh C'mon boy!. Another HF's steganography tool. There are many around there.

You are right. But this is mine and want to share it.

?

Oh wait...?Didn't see it:P

Well

Another HF's steganography tool. There are many around there.

You are right. But this is mine and want to share it.

?

Well, the concept is not the same ?

If we want to 'hide' this text:

Code Lorem ipsum dolor sit amet, consectetur adipiscing elit. Morbi a elit eleifend metus commodo fringilla at at felis. Nunc aliquet ultricies scelerisque. Morbi consectetur lectus quis gravida finibus. Vestibulum velit eros, vehicula sit amet bibendum pretium, sodales id dolor.

Forcefield output bitmap result:

With my 'uber haxor' tool we can select some existing image and 'really hide' the Text inside. The result can be opened in any bitmap tool, like Gimp, PS, Paint.NET,...

Also it can 'hide' an image file, mp3, zip, exe or any kind of file into selected bitmap.

This is the result:

If you open that image with PS you can not see any "strange", but that image contains [Code] text posted above.

As I said before, the concept is not the same.

No problems!
Hope it helps you:)

+Haze - December 16, 2016, 10:27 am
It's called Stenography
You can read up on it

I indeed know what is stenography.
But thats not for stengoraphy and the title is probably misleading a bit and I'm sorry for that:)
It's just for login systems and such as an extra security method.
