<https://hackforums.net/showthread.php?tid=2121733> this tutorial maybe helps

Zachariah12 - November 11, 2016, 10:59 pm

Post your skype and ill try to help you out. but try using (DarkTrack) Or (Babylon) I love them and they is free :)

Asdethprime - November 12, 2016, 12:55 am

Hi StayClassy,

Here are few advice that might help:

1) Simply DO NOT use Dark Comet - it sucks and has not been updated for years. Any anti-virus or it's grandmother is going to be able to detect it. Don't believe me, try it. Get a virtual PC and try and run your Dark Comet. Virtually every anti-virus (if not almost all) will be able to detect Dark Comet on both front: scantime detection and runtime detection.

2) If you really have to use a RAT try Quasar

<https://github.com/quasar/QuasarRAT>

1) FREE

2) EXTREMELY VERSATILE

3) BETTER THAN DARK COMET IN EVERY GODDAM WAY.

3) Remember a golden rule: if you want to prevent anti-virus from scanning your program as a malware use encoding and encryption. If you want to prevent anti-virus from detecting your program as malware when it execute use a malware that resides SOLELY IN THE MEMORY (RAM).

4) Look into other alternatives like : Metasploit Meterpreter (a software that allows you to pass a TCP command - i.e. just about every command imaginable - to a computer that has it installed AND running) and RootKit .

You have to code a Root Kit on your own.

A root kit pretends to be a system update on the victim's computer and when it is rebooted changes the content of _root_.sys

This is a Kernel level process that can DO EVERYTHING in your computer. It also opens a FULL TIME TCP access to the victim's computer to feed the command directly to the CPU. So you can do everything imaginable to a computer that is

a) Connected to the Internet

b) Has your rootkit installed on it.

Super hard to detect because no anti-virus scans root; nevermind scan no anti-virus would even come close to root.

Hope this helps.

dark comet is terrible, create your own rat.

kookur - *November 12, 2016, 1:01 am*

I've been using Njrat, it's free and works very well.
