Thread: [Nethunter - hostapd - aireplay-ng deauth on same interface possible](#)

To0OI00oT - November 12, 2016, 12:52 am

Hi

I have a Nexus 5 with Nethunter 3.0, i use a TP-link TLWN722N adapter and create a wireless access point with hostapd.

Now if i wanted to deauthenticate or jam another access point using aireplay-ng, would this be possible on the same wireless interface, because aireplay-ng needs the wlan to be in monitor mode, but it is already running the soft AP with hostapd.

Can somebody help me with a way around this??

Also is it possible to use an OTG usb hub with another wireless adapter, so i will have 2 external wifi adapters?? does the nexus 5 support this.

I look forward to hearing your replies.

Thanks

Open kali chroot in another terminal and proceed with aireplay?

To0OI00oT - November 14, 2016, 12:45 am

Hi pomwtin

thanks for your reply, yes i went ahead and tried running aireplay, it didnt work with hostapd but it does work with airbase.

I guess i would need another wireless interface to put into monitor mode for it to work with hostapd.

also i had a look at your work with HSTS and using the Network Time Protocol to defeat it.. Its very good stuff, good work.. i will try it out once i finish this project.

thanks
