Thread: [Store all the sold items of Shopify!](#)

DarkDelta - November 27, 2016, 7:17 am

I made a little script for [HackingDoge](#) and he allowed me to share the source with you all.

So, without further ado, here's the script!

PHP Code

```
<?php
import websocket
import json

def on_message(ws, message):
    j_message = json.loads(message)
    if j_message["event"] == "RandomShopProduct":
        with open("products_bought.txt", "a") as fw:
            fw.write("New product from " + j_message["hostname"] + "\r\n")
            fw.write("Product name: " + j_message["shopify_product"]["title"] + "\r\n")
            fw.write("Url: https://" + j_message["hostname"] + "/products/" + j_message["shopify_product"]["handle"] + "\r\n\r\n")
            print("New product from " + j_message["hostname"])
            print("Product name: " + j_message["shopify_product"]["title"])
            print("Url: https://" + j_message["hostname"] + "/products/" + j_message["shopify_product"]["handle"])
            print("-----")

def on_error(ws, error):
    print(error)

def on_close(ws):
    print("### closed ###")

if __name__ == "__main__":
    ws = websocket.WebSocketApp("wss://gopush.herokuapp.com/ws/private-all",
                                on_message = on_message,
                                on_error = on_error,
                                on_close = on_close)
    ws.run_forever(sslopt={"cert_reqs": websocket.ssl.CERT_NONE})
```

To set it up, run "pip install websocket-client" and then run the script.

It'll store all sold items in a text file in the same folder as the script and display them in the console as well.

Enjoy! ?

Awesome share, from your posts I can see that you are really experienced when it comes to programming.

Good job!

Looks like the website stopped updating for unknown reasons.

I must say that the script worked fine and got me lots of highly needed information.

DarkDelta is a BEAST!
