Thread: [\[TUTORIAL\] How to make a USB Autorun an .exe](#)

finnyy - November 28, 2016, 9:43 am

I will be teaching all of you lovely female dogs of how to make a USB autorun an application such as a RAT or Keylogger

What you need:

- A USB that you don't care about
- Your RAT, bot, etc
- Computers to infect

1.

First your going to wanna plug in your USB, then click start and press computer. Go over to you USB and right click and press format after that press restore device defaults. This pretty much just clears everything off your USB to make it run faster.

2.

Now that you have reformatted your USB, go to notepad and put this:

Code [autorun]

open=filename.exe

action=randomtextthere

label=renameflashdrive

icon=randomicon.ico

Here's what these commands do :

'open=' opens a specific file you want in your flash drive, Put Your Virus Name .exe

'action=' is what will be displayed on the autorun menu, you can name it anything really.

'label=' it will rename your flash drive to whatever is after the =

'icon=' will change the icon of the flash drive u can use a .exe icon or a .ico icon

Example of what I use:

Code [autorun]

open=networking.exe

action=networking

label=MyFlashDrive

icon=Hardware.ico

You can get any .ico off the internet and use that.

Now click file, save as and save it as autorun.inf

3.

You can close out of all that now. From here just put the your icon, your application, and the autorun.inf file on your USB.

4.

Now just plug your USB into any computer you see and then press enter, you have to press enter to select and run your server.

I hope you've enjoyed this little tutorial I made! :)
Thought I would share some after lurking for a long time.

V3N0M - November 28, 2016, 12:10 pm

Im going to go get my windows xp, to run it.

vfragtasticv - November 28, 2016, 12:29 pm

I use this method 2 year.
This method is leaked as fck :DD
But good share ?

VedItSource - November 28, 2016, 7:18 pm

Correct me if I'm wrong but I think that most PCs have autorun disabled, or at least will prompt and ask if you would like to autorun this USB. So unless you make your USB into a HID then you wouldn't be able to autorun your USB.
I might be wrong thou.

panda614 - November 29, 2016, 6:11 pm

nice gonna give it a try.

Heak - November 29, 2016, 10:27 pm

Works absolutely amazing thanks :)

chin89316 - November 30, 2016, 1:48 am

safe gonna give it a try.

Warxz - December 1, 2016, 3:27 am

Thanks! I had a lot of problems doing the autorun. Helped me alot!

dewoo - December 1, 2016, 3:49 am

Yes man that true all windows from 7 version will ask you..
and if installing av on pc on default setting disable autorun

Da7a - December 1, 2016, 7:36 am

I wish it was that simple anymore. Autoruns disabled on USBs on new OS. Tried this a while back, no luck.

G0Ch3ck - December 1, 2016, 12:27 pm

I tried getting this to work on Windows 10 and no luck. Is autorun disabled by default since vista or am I mistaken?

I would love to find a work around for this however, so if anyone has some ideas let me know!

kpown - December 1, 2016, 12:44 pm

This is outdated. Will not work on any OS Win7 and above.

Thanks for the share though. Autorun is disabled on modern OS

V3N0M - December 1, 2016, 12:49 pm

Get some Social Engineering to autorun it kinda...thats the most simple solution.

G0Ch3ck - December 1, 2016, 1:10 pm

@Headbanga

That's true, I've also considered the SE aspect and utilizing the Rubber Ducky to DL/Execute. I remember seeing a CD/DVD autorun tutorial recently, I think I may go back to that and pick up some tips. I've often considered using that method before with a mix of social engineering by writing "Honeymoon Photos" or something on the disks and leaving them laying around.

V3N0M - December 1, 2016, 1:20 pm

Look, a tip from me. Weakest point in a system is the human part in it. You can always bet on people stupidity, stupid curiosity and stupid greed.

It might not always run like it used to on vista or older. But hey, people didnt get smarter since then! ;d

Regulus - December 1, 2016, 1:23 pm

Nice share man, gonna give this a go :)

V3N0M - December 1, 2016, 1:29 pm

And to add up on the topic, attach the autorun to a picture or pdf or any not so suspicious file. Hide the other files also, attach them also to something. You can google how to hide files into other files. Not a bad idea to also put a script that deletes everything just in case :)

InjectOG - December 3, 2016, 12:40 am

Pretty cool post man, hopefully this still works.

xdavididhu - December 20, 2016, 8:40 am

Tried it before, not working on new OS's sadly.
