Thread: [HTML button dir help](#)

Jeffr3y - December 21, 2016, 11:34 pm

Ok so i want to make a button on my website that when you click it it takes your to a diffrent html file E.x.
your on the website in index.html you click the button your get transfered to test.html thank - Dat boi

ryan? - December 21, 2016, 11:36 pm

Code <FORM METHOD="link" ACTION="differentfile.html">
<INPUT TYPE="submit" VALUE="Button">
</FORM>

Bluffer - December 21, 2016, 11:38 pm

Couldn't you just add a href tag to the button element?

Jeffr3y - December 21, 2016, 11:43 pm

Pretty sure it shouldn't be done like Ryan suggested as it's a form sending nothing to another page. Same applies for the anchor around a button as its seen as very bad practice.

If you're using a framework like Bootstrap, there's really simple ways to make this happen by using:

Code Link

If you're not using any frameworks, then you could just make your own styles for the element.

PloxSource - December 23, 2016, 12:12 pm

Forms shouldn't be used for sending a user to another page for just a redirect. You only need a form if you're sending data through. Use an anchor tag like what the others have quoted above.

Whoaaaaa, seems a lot of hate is coming from this lol. Yes, it's better to do this as someone suggested.

```
<a class="btn" href="link.html">Link</a>
```

I posted that shit at 2am, relax people, you don't shoot the dude at burger king for accidentally putting onions on your burger..

I posted that shit at 2am, relax people, you don't shoot the dude at burger king for accidentally putting onions on your burger..Not having a go at all lol, it's Xmas. Peace & love ?

I think it's just better to say something so OP can know right okay, this works but its not really supposed to be done like this.

Happy Holidays ?

Jdxo - December 27, 2016, 2:14 pm

Im sure people reacted like that because that was a really obscure way to solve his problem lmao

...I didn't get that memo

Jeffr3y - January 13, 2017, 11:50 pm

all dis over a post asking for halp? im so confused
lol

They're offering you 2 ways to do it.

Best option:

Code

```
<a class="className" href="mylink.html">My Link</a>
```

and in the CSS...

```
Code .className{  
padding:10px;  
color:white;  
background-color:black;  
text-align:center;  
margin:20px;  
}
```
