Thread: [\[NOOB\] Questions about Rats and Botnets](#)

**LilDranky** - January 1, 2017, 4:35 pm

Hey !

Pls dont read if you dont like noobs and if youll only reply "check on forum, you stupid its so easy", etc ...

So I got some interest into Ratting and getting zombies and made some research for a good 2-3 hours.

So I found some advanced information but no beggining things like so I have so basic questions :

1. What is exactly a rat ? a code, .bat file ... And where can i find one
2. Do I need a software ? And wich one
3. Can you get some zombies for free (like getting them by yourself without buying servers etc...)

Thank you VERY much if you answered to these questions and also I only know C ,C# and a little bit of html/css language.

Im new to all this, the last think I "studied" were Cookie Stealers (basic stuff) and didnt even made one work.

Thanks for reading !

**Secrets** - January 1, 2017, 4:46 pm

hopefully the following links could assist you .

<http://hackforumswiki.net/index.php/RAT>

**LilDranky** - January 1, 2017, 4:50 pm

Thanks ! You answered my first question but umm theres another one that just popped up (hehe srry) how can i insert a rat into someones computer ? I looked and all I know is that the victim has to download a file but I dont know what file theyre talking about ... Thank you for you help Mr.Secrets

**Secrets** - January 1, 2017, 4:53 pm

The file is called a server , unless one renames it.  
It's an exe file which is executed when ran .

If the victim PC or slave PC doesn't have an up to date AV system (anti virus) then they will become infected by your file , the exe.

Say they have an anti virus ?

You'd have to encrypt your file to make it FUD ( fully undetectable ) from AV scans pickups .

1. you can find some here : [Remote Administration Tools](#)  
and it's a program (server) and a little .exe (client) you have screens in post-it sellers thread.

2. answer in 1

3. it's not zombies, but everyone that click on your stub become your client or bot as you want to call it. And you don't have to buy anything except you rat program or use a shitty free one and a crypter if you don't want your .exe to be detected by every AV.

Overall you don't have to program anything.

**LilDranky** - January 1, 2017, 5:03 pm

Thank you Hakai ! I wanted to code to pass a little time but now having to code is ok for me you helped me a lot with Secrets and umm Sheeple is the kind of person that I warned to not read my

post lol. Now I have everything I want and can start doing some shit thx all

**Hakai** - January 1, 2017, 5:06 pm

If you want to code rats isn't really the thing, you should go into linux and learn some things i know nothing about. Probably more entertaining.

1. A rat can be type of coded file, it can be C, C++, java, and some other languages. I along with other members do not suggest getting free rats, as they can be either ratted themselves or absolute shit.

Here are some of the best RAT's around: (IMO)

[Nanocore](#) - [\$25, lifetime]

Screenshot, not taken by me ([Click to View](#))

[Imminent Monitor](#) - [\$25, lifetime]

Screenshot, not taken by me ([Click to View](#))

[Luminosity Link](#) - My personal favorite [\$40, lifetime, I think]

Screenshots, not taken by me ([Click to View](#))

2. Yes, you will always need the rat software to control the rat. For example, if you're using luminosity link, you will need the luminosity software. However, if you're using something like Java rat (a rat coded in java, the advantage is that 1, java works on every operating system, and 2, most anti virus's don't detect java rat's as well easily as others) your victim may or may not need the latest version of java installed.

3. What do you mean for free? Servers are the files that are infected with your rat. If you're talking about spreading methods than there are lots of those for free.

Also, html and css will be completely useless with RAT's. However, C, and C# will be very useful. Things to remember:

- FUD means fully undetectable by anti virus's. Most servers can only last a few days remaining undetected

- To make your rat FUD, you need a crypter. Again, I don't recommend a free one. Crypters crypt your rat file and make it FUD/UD.

- AV means anti virus

- Keep in mind most AV's have databases that they report back to when they suspect a file is a threat. Correct me if I'm wrong, but if your rat was detected on say Norton AV, and determined to be a virus, all of the Norton AV's on computers will now know you're a virus. Read more on AV databases here:

[https://en.wikipedia.org/wiki/Antivirus\\_software#Signature-based\\_detection](https://en.wikipedia.org/wiki/Antivirus_software#Signature-based_detection)

- NEVER scan a RAT or crypter on virustotal. The reason is because virus total scans with 36 different AV's (or maybe more) and they all report back to a database. Instead, use things like refudme. (Google it)

I hope I helped, PM me for help, or reply.

**LilDranky** - January 1, 2017, 6:12 pm

Yes you really helped me it was like a full tutorial ! Now I only need a jRat ... i will try to find one if possible for free because I saw something call DarkTrack and people say its good. Anyways thank you very much ill get into ratting tomorrow and I hope ill get some slaves !

Hey um I downloaded NJRat and when I open the file that a extracted from the zip I saw the .exe 1 sec then it disappeared (other files too) I reopened the folder and theres just some files that I dont want (how to use, plugins, stub manifest) but no .exe program :( I think its because windows thinks its a malicious file (its a trusted source i downloaded dont worry). Um help id like to try the rat

downloads rat  
still has antivirus enabled

and you need the plugins and the other folders you dumb bitch

**Hakai** - January 1, 2017, 6:31 pm

so long story short you need to turn of your real time scanning on your AV or add exceptions.

**LilDranky** - January 1, 2017, 6:37 pm

lol hehe xd knew it

hey ur kinda useful sheeple and <3 hakai

So basically I have the .exe server file now I make someone download it right ? Im pretty happy that it works thank yall EVEN Sheeple haha

just look at a tutorial, you need to create a dynamic DNS that goes to your IP, you need to get a static ip if you don't have a VPN, and you should test it of yourself if you have a second computer before trying to spread it.

You can come here and ask question everytime it fails but it will take ages.

You need to open ports on your router and on your windows firewall aswell...

Just find a tutorial. There are plenty.

Or ask in the rat section for a mentor on skype.

**Essence** - January 1, 2017, 7:05 pm

No way in hell you searched for 3 hours if your questions are that simple..

**Levi** - January 1, 2017, 7:49 pm

Why are you so eager to create/distribute malware?

**Hakai** - January 1, 2017, 8:00 pm

Dude, it's a RAT... Of course it will be detected by your AV, turn it off when downloading...

Here's a dark track tutorial with download link: <https://hackforums.net/showthread.php?tid=5322891>

I googled refudme and it was shutdown in 2015.
