Thread: [Swift coding\[iOS\]](#)

Dronza - January 9, 2017, 10:56 am

Hey!

I decided to make a post in this section because Swift is just an updated version of objective-c.

So what I need help with is, I want to create something in XCode(Swift language) that just heats up the phone(preferably with an on and off switch). All and any help is appreciated. I can pay if necessary, but I feel like it shouldn't be too hard.

Thank you in advance!

Well the reason a phone heats up generally is because the processor does, and a processor does when it's being overworked. The basic premise is to keep the phone's CPU at 100% using a sort of loop or running math equations or very powerful graphics or any other method. This should heat up the phone. Of course when you turn it off it won't cool down quickly and battery drain will be significant. Sadly I don't know Swift/Objective-C well enough to code it for you. Hopefully you get the idea however.

Thank you for your help. I get the idea, and I will play around until I find it working, again thank you!
