SilentBytes RAT [DEMO]

Hey guys, have nothing to do so thought I could release a old version of my project "SilentBytes Rat" for free and give something to the forum, Note that this version is old and have bugs so i wouldnt use this version as my main program to administrate my machines.

Difference between this and what will be the full version?

This build is an old build (maybe 2.5 weeks) and the RAT have improved alot since that so i felt like i could release this build for free.

If you have time to report bugs/give reviews or just tell me some suggestions I will give you a discount on the final product if you want ?

This software is intended to be used for legal purposes such as administrate your computers at home or just play around with it on your own computer. DO NOT USE THIS ON COMPUTERS YOU DO NOT OWN OR HAVE PERMISSIONS FOR!

Here is the Development thread if you want to follow the development:

Hope it isnt too bad ?

Haven't even looked at it yet but I'd like to thank you for the release.

I will update this with a review eventually, if I don't forget.

Also there's really no point in 'protecting' this DL.

It looks good man. Not using RATs currently, but this is a cool thing to give away. Anyway, how is the source encrypted - so it doesn't get decompiled, as it is java?

Thanks a lot, i might try it out soon !

You actually think I can be bothered to do a Double base64 just to download something that looks like something I can grab off github?
In what universe are you living in dude?
