Omniscient - January 15, 2017, 10:27 am

Sorry, appears we were offline for about 10 hours. Some server updating done yesterday appeared to have screwed up the php service. So at 12:30 for a cron job when it did the restart the service died. No PHP means no HF. I was offline until now. Only took me about 15 minutes to fix.

Sorry about that. All good.

Actually, I already get alerts about downtime. Unfortunately my phone was in my office while I was not. Woke up to see 100+ notifications.

Quote:The discord servers were shittin' bricks thinking some FBI investigation into the servers caused it lmao

Every time there is extended downtime people panic. Realistically if it's in the middle of the night chances are that I'm just offline (sleeping).

And part of the problem is my complex setup. I may end up building another server and moving some services to it. For now the setup works but it's only a matter of time before it just breaks down from a compatibility problem.

Should set up some third party monitoring just to check status so you get alerts when it's offline.

Pushover is a great app for notifications on your phone if you want something separate from emails / regular messages.

I don't do that.

Quote:However, the PHP update messed up, and PHP was not restarted until the cronjob.

There was no PHP update. However the php start script wouldn't run because a library was messed up from an update. Normally these server library or binary updates have no effect on services I run like php, apache, nginx but this one screwed up the startup script. No big deal and easy fix.

Thanks everyone.
